NUM. 1.

THE MOULDEBAERT.

AN IMPLEMENT IN FLEMISH HUSBANDRY, AND HIGHLY RECOMMENDED IN RADCLIFFE'S REPORT, &c. &c.

It has been recommended to us, by a friend of excellent judgment, to whom we loaned the report of Flemish husbandry, to cause an engraving to be made of the mouldebaert, as it is called; which seems to have served as a model of the scrapers used in the construction of turnpike roads, cattle water ponds, &c. It is obvious, that such an implement, of cheap and simple structure, as it seems to be, would be highly useful on all farms. Whenever it is desirable to gather up and remove the surface of the ground, this machine would aid in the operation, with great saving of labour. By should suppose that it may also expedite established its general use in Flanders, and ought greatly, the formation of rough ditches and drains, t lead off the superfluous water of low lands; and every observant farmer, knows that such lands, let seasons be as dry as they may, go forward, collects, and transport, which has figure at attention also, as is always the case in Flanders, to the removal of weeds, and that the foregoing operations both of ploughing and sowling, should be performed in dry weather.

By these means, this intelligent gentleman such lands, let seasons be as dry as they may, go forward, collects, and transports about 5 cwt. never produce, to their full capacity, if water be allowed to settle on any part of them. We which is effected in the most summary manner, however, discharge our duty, in submitting to by his letting go the handle. This causes the

our patrons, a view of this contrivance, so highly recommended by the able author of the report in question, and feel that we may safely leave it to their better judgment, to turn it to Edit. Am. Far.

Description of the Mouldebaert-and Manner of reclaiming Wet Land.

This implement is called the mouldebaert, and resembles a large square malt-shovel; it is strongmeans of it, for example, an old dunghill, the ly prepared with iron on the lower side; and is ground immediately about kitchens, and farm houses, after being ploughed up, would be readily gathered into heaps, for the cart, to be removed to the compost heap—so with old graving, laid down by a scale, will explain its head land, the line of old fences, &c.—We torm and dimensions. Too much, however, have accordingly caused it to be engraved, and easiest and most expeditious manner, which has

front, or edge of the machine, to dip, and catch against the ground, whereby it is at once inverted and emptied of its load. The extremity of the handle, to which a rope is affixed, by this inver-sion strikes against, and rests upon the swingletree bar, and in this manner the mouldebaert is drawn along towards the accumulated earth, when, by taking up the rope, the driver draws back the handle, collects his load as before, pro-ceeds to the spot which is to receive it, and the horses are never for a moment delayed.

The saving of time and labour, in filling, and emptying, gives this implement a decided superiority over the cart; nor is the ground so much injured by this, as by wheels. How well may it be applied in manuring a field with compost from the head ridges; and how valuably, in most cases of levelling, either in the farm or the de-

mesne?

Having formed the broad sets as has been mentioned, by means of this valuable implement, the next chief care was to get rid of the surfacewater, by cutting trenches across them with the spade, where required, and by clearing up all the Ad ditches to give it free passage, an operation repaid by the manure thus procured, which being turned and exposed to the atmosphere for a season, was spread upon the surface with good effect. The improvement of this land, however, was only to be compassed through the medium of a perfect fallow. In autumn the fields received a light ploughing and harrowing, and the sets were then forced: in December, a deep ploughing, to lay the soil up high to the influ-ence of the frost; at which period the transverse furrows were cut to let the water run off. In March another deep ploughing and harrowing, after which the manure raised from the ditches was spread upon the surface, so as to preserve the rounded form of the sets. In August, quicklime was spread in a pulverised state, at the rate of sixty hectolitres to the mesure, about one hundred and fifty-six bushels (Winchester) to leave it to their better judgment, to turn it to the English acre; and laid under, by a light the best account. It will be a satisfaction to ploughing. This terminated the preparation, know, that it has been tried and found useful.]

1st year Winter barley, No manure, but the 2d. Beans and Flax, previous liming, &c.

equal moieties,
3d. Winter barley, with a moderate application

of urine, in the spring, 4th. Beans, vetches, and turnips,

5th. Wheat or oats, with clover, 6th. Clover, manured with ashes,

7th. Clover cut once, and ploughed under,

8th. Potatoes, with farm yard manure.

From this the same succession begins again; but the land received a second dressing of lime. fully adopt the opinion of our friend, as cannot be said of its efficacy in removing soil The greatest attention was paid to the clearing to the general utility of the mouldebaert, and from one part of the field to another, in the up of all channels, for the water to pass freely; up of all channels, for the water to pass freely;

foregoing operations both of ploughing and sow-ing, should be performed in dry weather.

By these means, this intelligent gentleman succeeded in producing crops that amply repaid

Domestic Economy.

EXPERIMENTS IN REARING POULTRY

REMARKS ON THE CAUSE OF THE GAPES IN CHICKENS, AND THE BEST METHOD OF AVOID ING .- With Editorial notes thereon.

TO THE EDITOR OF THE AMERICAN FARMER.

Dear Sir,

* Whether worms in the throat, be the cause,

from the earth, the sun drives them below the this coop I put in a dry and healthy situationsurface. That there is something in old dunghills, unpropitious to the rearing of barn-door fowls, is well known, for it is invariably found, that they succeed best, where new establishments are made on new ground-doubtless, too, the vermin that infest old poultry houses are de-structive of the health and life, both of young and old fowls, ploughing up and removing the surface of old dung hills—frequent and thorough cleansing, by white washing and other means, of the nests, coops, &c. &c. are indispensable pre-cautions. Millet, we are told, is for houltry, birds. birds and mice, the most acceptable food that can be put in their way-and they are, it may be presumed, good judges of what is suitable for them.

While on this subject, let us add a word on

the subject of

INCUBATION.

It happened the other day, that in company with a pair of charming young ladies from the country, we volunteered our services, to recommend them to a pair of clever young fellows, who had solicited our aid in the same way; but we required, as the condition of our good offices, that these fair nymphs should submit, to an examination on certain points of housewifery-knowledge, and accordingly amongst other questions, we catechised them on the time of incubation, and the number of eggs to be committed to different fowls.

well, much better than some young lawyers we have known, but being deficient in some particulars we here submit for the benefit of themselves, and others, the following table of themselves, and the following table of themselves are table of themselves are table of themselves are table of the following table of the following table of themselves are table of the following table of the fo others, the following table, which we would have learned by *practice*, as certainly as they learn their multiplication table, if they would would otherwise do, in order to get the water prepare themselves as they ought, to obey the with which the food is moistened. This should junction of scripture which-we need not quote drawn and washed, whenever used.

Upon motion Resolved, That Sydnor Bailey, last meeting, in competing for the premiums disgreat pleasure in communicating to the society, Esq. and Cuthbert Powell, Esq. of Loudon county, tributed, for the first time, by our society. If, in the infancy of our institution, such a spirit has ter, from Mr. Elkanah Watson, president of the the infancy of our institution, such a spirit has ter, from Mr. Elkanah Watson, president of the The following members were appointed a com- been awakened, what may we not expect in its Berkeshire Agricultural Society, in Massachumittee of arrangement to form a scheme of pre- progress to maturity, and the exertion of its en- setts, together with his pamphlet, entitled, "Hismiums, to be presented at the next meeting in ergies to prevent that spirit from slumbering into tory of the rise, progress, and existing state of August, viz: H. St. G. Tucker, Wm. M. Bar-the torpent state in which we found it at our that society." On the back, or cover of this ton, Joseph Kean, A. H. Powell.

Commencement? As we are bound, collectively pamphlet, will be seen a list of seventeen varies on the back of the pamphlet, sent by Elkanah and individually, by the ties of patriotism, bene-ties of grain, just then arrived from the south of On the back of the pamphlet, sent by Elkanah and individually, by the ties of patriotism, benewatson, Esq. to this society, was a description of a species of wheat, introduced into Massachusetts, which is found peculiarly fitted to resist the Hessian fly, from the hardness and solidity of its stalk, thereby opposing resistance to the peculiar location of this insect. It was therefore resolved, that Wm. M. Barton be appointed to procure fifty bushels of said wheat, and to distribute the same among the members of this society, not exceeding two bushels to each, who will first pay sisting in this great work, commanded to be done,

Although thus fortified, we do not claim for it a superiority which will do injustice to other employments, springing, in the progress of society, out of its density of popula-tion, and natural advantages for acquiring wealth. No! We seek only an ancillary association with commerce and manufactures, preserving an equilibrium of interest, so far as government holds the balance. Without farther touching the question which seems now to agitate our national some respects from the ploughs which he has councils, I will proceed to present a few ideas heretofore been in the habit of successfully ma- more immediately connected with the object of

neatness and beauty could not be excelled) and crop, and also to the soil which produces it, Whatever may be the facilities employed, either turnpike roads or canals, a reduction of one half of the present price of carriage, where such conproduce twenty bushels, which will make four

weight which is necessary to propel ploughs, of which three dollars is interest, viz. \$50. But if this seems to be an incredible result, (and it is admitted to be so, as it regards the entire tract or plantation) strike off five-sixths for the idle shifts, varieties of crop, and woodland, and there will be left \$8.33 per acre, additional value to the entire tract. Thus it will be seen, gentlemen, how the functions of the arteries and veins of the We human body, contributing to its health and existence, correspond with those of roads and canals in the body politic, preserving its salutary state; and yet we have hitherto preferred to labor under a consumption of nearly one-fourth of the product of our farms, sooner than incur a present evil, for a distant good, by beginning the great work of improvement. When interest, because Indirect, ceases to be the impulse to human action, how long, my fellow citizens, will it any other person; and transmit such immediate- address, which I regret is not more worthy of be, before we discover the antidote to this slumbering lethargy? Alas! I fear it will be found that "then there is no balm in Gilead—no physician there."

Blighted in our hopes and prospects, as to our principal crops for many years, sometimes de-stroyed or injured materially, by the Hessian fly, and then by frost, or both, no effectual rememark the spirit of emulation, manifested at the dy has hitherto been known to us. Now I feel great pleasure in communicating to the society,

large, as hard as flint-with a thin husk, and of Adam Smith-makes the very best of flour-as white as snow. "Whatever tends to diminish in any country It resists the winter better than any other, and "the number of artificers and manufacturers, ripens fourteen days earlier." If the experiment of growing this wheat by the side of other fields -and its succeeding when its neighbors was destroyed, be not conclusive as to its resistance of the fly, (because we have seen that to happen with fields of wheat, both of the same sort,) yet range of political economy, is an eternal reproach stroke at the policy of Mr. Garnet, noticed befrom the character of the stem, it is highly probable the fly would not select it as a location, congenial to its propagation. The account of this wheat, now detailed, is so imposing, and from so respectable and disinterested a source, that it is submitted to the society to decide whether it will lend its agency to procure a quantity of it worth distribution; or leave it to individual enterprise. If it will answer the purpose attributed to it, we can render no greater benefit to the agricultural interest of our country, than by a successful experiment of its use. While we are on the subject of this destructive insect, Hessian fly. I will take the liberty of warning the public of an error generally prevalent, but by no means one of much consequence. An insect much resembling the Hessian fly, will often be found, even in winter, in, or rather a little above. pies the hollow tube of the stalk, and (unlike the per cent. we increased the quantity above 33 pies the hollow tube of the stalk, and (unlike the per cent. This is somewhat like realizing Dean injury, as I perceived from a hunch of what little Swift's arithmetic. nished me by my worthy friend, the vice-president. This insect, I was informed by a gentleman in Fairfax county, a nice and critical observer of these things, is called the joint worm, and not our staples is considered, this fact will fully acthe Hessian fly. Some entomologists having count for the reduction of prices. fallen into this error, as I deem it, these remarks are thrown out for their, or my correction.

I am sorry, brother farmers, that I have so little to lay before you, cheering to you, as tillers of the earth. In the prospect before us, there is a frightful era, full of suffering humanity, and portentous forebodings, which may reach us, but which we hope God may avert. In one portion of Europe, liberty has been prostrated by the arm of despotism; in another she lies bleeding, -shrouded in death, and bathed in blood -History will record the epoch in its blackest page, and warn posterity to avoid a repetition of the dreadful scene. We must abide the gathering storm, and it driven from the repose of our own vine and figtree, breast it when it breaks, like men determined upon the salvation of their freedom,—heaven's best gift to man. In the mean time, by the practice of economy and industry, we may struggle through the embarrassing times, and avoid the error which led to them.

An appeal to the charity and sympathy of the society becomes necessary; and as an apology for the poverty and brevity of this address, I offer the awful affliction of a wife, occurring some six weeks since, and a continuance of her agony even to this hour.

-For the American Farmer.

EXTRACT FROM AN UNPUBLISHED PAMPHLET, ENTITLED "A WARNING VOICE TO COTTON AND TOBACCO PLANTERS, AND GROWERS OF GRAIN."

Pernicious operation of our present system on the interests of the Tobacco Planters.

Having, as I trust, established the utter impolicy of our system as regards our cotton planters, I proceed to detail its effects on the t bacco planters, by glutting the foreign markets, the inevita- M. Duncan & Son, Liverpool, January 1st, Liverpool, 7th February, 1824. ble consequence of the depression and ruin of the 1823.

which suffered greatly .- The grain is full- manufacturers, and neglecting the sound advice Last year we exported a still great-

February, 1824.

TO THE EDITOR OF THE AMERICAN FARMER.

MARL,

ITS APPLICATION AND EFFECTS ON VARIOUS SOILS.

Prince George, March 12th, 1824.

DEAR SIR, Having been some time from home, I did not until to-day, see the call on me in the American Farmer of February 27th, and the private note from you on the same subject. I feel highly gratified, that your correspondent "Agrestis," has experience of the correctness of my opinions

noticed by him in Maryland.

Since my former communication on this subject, (contained in your 3d vol.) I have marled "clay soils, that were literally good for nothing, on the cloth being removed, he addressed the "have been regenerated by marle alone, and pre-"sent the appearance of our best and natively "I have long wished to see meetings assem good lands." I still believe that the use of calcareous manures, will not be found very profitable, except on lands not grazed, or which are in the auspices of the Highland Society of the first crop from 50 to 100 per cent .- and under

palling state of things, as regards the staple of results proportionable to the first," nor will its comparing their respective properties and defects. his state, as well as cotton, lately contended in mode of operation justify such expectations. In Congress, that the reason of the decline of our every thing else stated by Agrestis, his experience and perseverance, may do much in ameliorating exports was the high duties to which foreign goods are subject! and that if they were reduced, it would increase the demand for our staples. The improvement is evidently progressive, and it would increase the demand for our staples. I believe, will continue to increase, until the soil without such meetings as the one which we have abroad! notwithstanding the strong and palpable is brought to its maximum of productiveness, or this day witnessed. The great importance of facts, that our imports exceed our exports—that until the new accumulation of vegetable matter, the subject, to which I beg leave to call your atall the markets in the world, wherever our productions are received, are almost constantly gluts and of acidity, cause a necessity for a second drestention, can hardly be questioned. In fact, by sing of marle, which then will operate in the much the largest proportion of the territory of ted with them—and that, in consequence of this same way, and with as much profit, as the first almost every country is devoted to the breeding

ously reduced. When the legislators of a great nation enter on the performance of their duties in The plants which are most abundant on acid soils, above 15 millions are devoted to that object. a state of mind so wholly unprepared for the will thrive on no other kind; and therefore, are The live stock are the most essential to the culperformance of those duties, and with views so destroyed at once, when the soil is made calca-tivation of our soil-they supply a large proporradically unsound, it cannot be wondered at, that reous. But your correspondent will not find this tion of our food—they furnish materials for cloan general distress overspreads the face of the clean state of marled land to be permanent—thing, and contribute to a variety of our most land—and that the true panacea for our evils, the One set of pests has been removed, only to allow useful accommodations. Objections have been building up a domestic market for the produc- another to succeed. Wire grass, is more benefit- made to the idea of fattening cattle and sheep to tions of the earth, is as ardently opposed as it was ted by marl, than any other plant that I know of; the extent so frequently practised at such shows: during the wars of the French Revolution, when the European demand for our great staples, pre-vented the natural consequences of our unwise and pernicious system from developing them- blue grass, may be considered in the same way, certaining to what degree animals can be fattened, "the few sales effected are at very low rates, years. This grass is scarcely ever seen in this must be derived from the knowledge which is "even under my quotations, when pressed on the part of the country, and there is not any where thus obtained regarding the means of fattening market." Daniel Buchanan, Liverpool, 14th enough to be troublesome, except on the best stock, in a lesser degree, at a moderate expense neutral soils, which I suppose to have been origi- and calculated for general consumption." nally marled by natural means.

SALT.

A specimen of coarse salt manufactured by B. Byington, at Salina, in the western part of this state, has lately been analysed in this city by Mr. G. Chilton, Chemist, and is proved to be superior in purity to any salt ever known in this market. The following is the statement of Mr. ployed in making the pisé work of both these Chilton:—The specimen of coarse salt left with buildings. I have the foundation laid for another, 7th instant. The Governor, in his speech, information in the contraction of the coarse salt left with buildings. me for examination, and which was manufactured by Mr. Byington, at Salina, in the state of New York, proves by a careful analysis to be muriate of soda nearly pure, 1000 parts by weight this mode of building, over every other now consideration. He concluded by holding out a yielded 994 parts muriate of soda, 5 oz. sulphate of lime, and 5 muriate of magnesia, without any sensible deposite of insoluble matter. A comparative estimate of its value may be obtained from the following table of results of the analysis of the different varieties of salt by Dr. Henry.

1000 parts	consist	Pure Muriate
of kinds o	of Salt.	Soda
From bay	(St, Ubes,	960
salt	St. Martins,	9594
	Oteron,	9643
	(Scotch (common)	9353
Bail'd fr'm	Scotch (Sunday)	971
sea waters	Lymington (common)	937
	(Ditto (Cat)	988
	Crush'd Rock,	9831
Cheshire	Fishery,	9363
salt	Common,	9834
	Stoved,	9823
	Byington's,	994

It is believed that Mr. Byington's process is similar to that which, in England, has been employed many years in the manufacture of Coarse Salt by artificial heat, and which salt, in that country, is considered inferior for the packing of provisions, to the Bay salt, or common coarse salt, produced by Solar Evaporation.

PISÉ.

Mode of building-Its durability and economy by experiment in South Carolina.

TO THE EDITOR OF THE AMERICAN FARMER.

In a letter which I had occasion to write to you in the beginning of the year 1821, I mentioned that I was about to make an experiment upon Carfin, Mr. Stewart, pisé building, by the directions contained in a book, published by S. W. Johnson of New Bruns-wick—I commenced early in April of that year, Jarvieston, building a house 14 feet square, with walls 18 inches thick, for a dairy. It happened to be an extremely wet month, and it became necessary to stop the work, on account of the frequent Cambusnethan, rains, and wetness of the earth, after completing Garrion Haugh, though not very well protected,) until the middle Carfin,

three winters, I cannot perceive that any part of the roughcasting, which is exposed to the weather, has sustained the slightest injury. The pisé work has become as firm and solid, as the stone foundation upon which it stands, and I have not the least doubt, that the roughcasting will be as durable, as it would be on stone or brick walls. This experiment has satisfied me, that stone and brick are not necessary for the most permanent dations, 12 inches above the surface of the earth, or somewhat higher in those parts of the country

where there are drifting snows.

In July last, I built another house of this kind, 30 feet by 16, with a chimney and partition in ble lodging rooms, for my house servants. This of draught cattle. trial has succeeded as well as the first. My ordinary field hands were the only labourers emwhich I expect to build in a few weeks, and when 7th instant. The Governor, in his speech, informfinished, I hope to have it in my power to fur- ed the Assembly, that a plan for draining the nish additional evidence, of the superiority of Lake of Haarlem and the Bylmeer was under practised in this country, both for cheapness, and the expedition with which the work may be car. being accomplished. The lake of Haarlem, which ried on, and inferior to none when well executed, in point of durability, external appearance, and internal comfort. The houses which I have the large of Haariem, which to communicates with the Zuyder Zee by the river Y., is extensive, but not deep; it is about fourteen miles long, and from seven to ten broad. According to the large of Haariem, which to be a small between the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which communicates with the Zuyder Zee by the river which the large of Haariem, which is the large of built are small, but I am satisfied, that buildings ing to tradition, it was formed in the year 860, at of any dimensions may be made in this way. I the same time that the Rhine was intercepted by have not experienced the difficulties complained the formation of sand banks near Catwyck; but of by Mr. Cocke of Va. in a letter published in Some persons who have investigated the subject, Vol. 3d, page 157 of the American Farmer, and am of opinion, that nothing but delay would be place at a period considerably more recent It gained, by making the pise work in blocks, and is stated in old chronicles, that an irruption of the building afterwards as with brick and mortar, in- sea destroyed at once seventeen villages, and, acstead of building upon the foundation, according to the original method.

THE FARMER.

BALTIMORE, FRIDAY, MARCH 26, 1824.

TOBACCO.

Allegation of fraudulent packing, and unfaithful

Inspection.

In relation to this subject, it may be affirmed, that our readers have in it, a *peculiar* concern. 20 per cent.—144, do. 40—133, do. 15—140, do. If merchants are concerned, that no imposition 15—147, do. 33 1-3—137, do. 40—141, do. 15—140, do. 15 more concerned, that their reputation suffers no 15 detriment, by the suggestion of fraud, which has had no existence, or that if fraud have been committed, the authors should be designated. When, to have been principally done by the planters-It may be well, Messrs. Editors, to give in if ever deceptious packing shall be practised and the samples however of some, have no doubt your paper some explanations of the statement connived at by inspectors, the general character been changed or the inspection has been very recently furnished to Congress by the Treasury, of the whole article from the state, will be disof the situation of the Bank United States, that credited, and the reputation of the whole comed by the improper conduct of a few of its unworthy members, especially in the estimation of between the Inspector's breaks in the fine tobacwill compare, the Loans on the 1st January 1823, foreigners; for the more distant the point of observation, the greater will be the difficulty of disare thus liable to be underrated, by the blemishes of a few. Hence we contend, that the planters themselves, are more interested than the shippers, that the inspection of their staple article should be fure and rigid, and we have no be correct. hesitation in declaring our thorough conviction, that there are few, very few, who do not feel this may be of service in future operations." and act in the fullness of this impression. If, as and persevering than some others, in detecting letter was written.] the frauds perpetrated against them; none revolt more instinctively at the idea of committing

It is not then on light testimony, or a partial disclosure of circumstances, that we should put abroad rumours of fraud and collusion in packing and inspecting. It is hardly sufficient in these cases to give the numbers of the hogsheads, and the names of the warehouses-these particulars ought to be accompanied with the names of the inspectors and planters. It is due to them, that they should have an opportunity of self exculpation; it is no less due to all other planters, that they may clear their skirts of suspicion-they have a right to demand day and date, where re-putation is involved, surmises should be reduced to names and facts, for

" Rumour doth double, like the voice and echo, " The numbers of the feared:'

We have often heard of false packing, and collusive inspection, demonstrated by a material va-In the present situation of things, this stock is riance between the American and the Bremen of Calvert county, (IB3820)—this was a hogshead amplement investment of samples, those rumours are now presented in a of seconds, sold with a large parcel from that so much more specific shape than usual, that we

The letter THE TWO STEERS raised and fattened by from Bremen, speaks of the probable change of samples.

TOBACCO TRADE.

Extract of a letter from an American gentleman of Baltimore now in Bremen, to a shipper

of tobacco in this city.

BREMEN, Jan. 25, 1824.

Having been requested by Mr. Frederick
Rodewald to examine a parcel of tobacco consigned by you to him, I have found after a close examination, the following to be the result, between the Bremen and American samples, viz: No. 125, a difference of 40 per cent. in favour of the American sample-this hogshead is falsely hacked, as I perceived tobacco in the same, between the American breaks, worth about three or four dollars. No. 123, this hogshead is packed in the same manner, only much worse, therefore I conceive the difference to be full 66 2-3 per cent. No. 143, the American sample represents fine scrubs, worth about 14 grts. but the Bremen sample about 5½. Nos. 132, a difference of 20 per cent.—144, do. 40—133, do. 15—140, do. be practised by false packing, planters are yet 134, do. 50-128, do. 25-138, do. 20-139 do.

The above state of your tobacco evidently shews great fraud, which I perceive by the hhds. unfair. Nos. 125, 123, 143, 147, 144 and 134, are infamously false packed, the manner of munity, employed in its production, will be taint- which, you have often seen, therefore I can only say it is done in the usual way, by packing trash cos. I have also found, in hhds. 7821 and 7822, a considerable quantity of green tobacco as lintinguishing the black sheep, and the whole flock ing, which does not appear in the samples taken with you.

You may depend on the samples having been taken correctly by Mr. R.'s coopers, as I have often witnessed the manner and found them to

I am sorry to communicate bad news, but hope

The thirteen hhds. mentioned in the above exa class of the community, they are less acute tract are all that were inspected at the time the

To the Editor of the Morning Chronicle.

SIR-I perfectly agree with the writer in your paper of Thursday morning, signed "A looker on," that the gentleman who furnished the extract, should not have stopped there, but should have given the names of all concerned; that not being done, I take the liberty of giving the following statement of facts relative to the tobacco inspected at Smith's warehouse, as they presented themselves at the time, and leave the public to judge of this matter for themselves, and let censure fix, where censure is deserved.

The extract alluded to, is from a letter from Mr. Rignal Mullekin, now in Bremen, to Mr. Dennis F. Magruder, of this place.

Eight hogsheads out of thirteen mentioned in the extract, were inspected at Smith's warehouse, and six at Calhoun's;* how eight and six should make thirteen, I am really at a loss to know.

No. 143 in the extract, made by Isaac Bowen

^{*} Richard Mackall, inspector.

county, (WS3993)-this was a hogshead of new tobacco, inspected in the usual way, and in pre-sence of a number of dealers, Mr. Gust. Magru-to either Mr. G. Magruder or myself.

Turkeys, 75 cts. to -1—Geese, 50 to 56 cts. —Ducks, Canvasbacks, \$1 25 to 2—Red heads, der among them, who saw all the breaks as well as the samples, and bought by him immediatelyno appearance of raise or fraudulent packing, or mixed qualities of tobacco.

No. 138, 139 and 140 made by Nicholas Gorsuch of Baltimore county, (NG3909, 10 and 11) instances of detraction, one in particular, only a sence of M. G. Magruder and others, and bought similar impositions still are practised. It would by him immediately-no appearance of fraud.

October, or early in November, and re-inspected be, he is not the man. in his presence, when his entire satisfaction was expressed at the good order and appearance of the tobacco.

For Sale.

A valuable and well improved Farm in Frederick County, immediately adjoining the town of Westminster, belonging to the estate of the late substantial chesnut rail fence; between 50 and 60 acres are in thriving young timber, which has teen years, and is now capable of furnishing an ample supply of wood for the farm; about forty of natural meadow are now in grass, the residue is divided into convenient fields. The buildings consist of a comfortable dwelling house, barn, stables, dairy, &c.

The adjoining farm being part of the same tract of land, containing 100 acres of prime land, is also offered for sale-20 acres are in fine timber, the remainder is divided into fields of suitable size by good fences; the whole in a high state of improvement.—The buildings consist of a convenient two story brick house and kitchen, barn, stables, and other out houses, all recently erected, and in excellent repair. These two farms, to a purchaser of both, would form a most desirable establishment; they abound with springs of the purest water, and it may be affirmed that no situation in Maryland is more remarkable for its uniform healthfulness-the distance is twentyeight miles from Baltimore, the road turupiked the entire distance; and the Chambersburg mail stage passing through Westminster three times a week, (where the passengers arrive to breakfast) affords a quick and easy communication.

One other tract of land, containing ninety acres entirely in wood, lying one mile from Westmin-ster, on the Union Town turnpike road, is also offered for sale-there are on it several springs, and a good proportion of natural meadow

The above property or any part thereof, will be sold free of any incumbrance whatever, either for cash or on a credit at reasonable prices-possessions can be immediately given.

Persons wishing to view the premises, will apply to the manager on the farm, and for further particulars, to the subscriber in Baltimore D. WINCHESTER.

AGRICULTURE.

MARL,

ITS PROPERTIES AND USES ON VARIOUS SOILS

The Maryland Academy of Science and Literature, an institution devoted to the promotion of the useful sciences and polite letters, have re ceived with much satisfaction through one of its members, Mr. Skinner, the Editor of the American Farmer, several interesting specimens of the natural productions of our country-many of which are applicable to agriculture and commerce. The Academy invite the attention of their fellow citizens to the objects upon which their labours are employed-they will cheerfully investigate all objects in natural history which may be sent from the diversified soil and climate of the United States, and explain their history and uses. Among the objects already presented to their notice, is a box containing specimens of shells in a state of decomposition, which has been applied extensively and with great benefit to fertilizing the soil, under the name of marl, by Messrs. R. H. Goldsborough and S. T. Kennard, farmers distinguished for their elegant and useful acquirements and publick spirit. The Academy, through one of their committees, has investigated these specimens, and place the following report in the possession of the Editor of the Farmer, as the result of their inquiries on the subject:

The committee appointed to examine the specimens of supposed marl, remitted to the Academy by Mr. Skinner, from Messrs. Goldsborough & Kennard, beg leave to report in a more formal manner, what they expressed as their opinion at the former meeting, viz .- That the specimens are not to be considered as specimens of marl, but merely fragments of shells, more or less disintegrated; and one parcel in division, No 4., owes its colour to the oxyd of iron-nor can they discover in either of the eight specimens any thing to warrant the belief that such as they are, they can be considered as indicating beds of marl from which they have been drawn.

Your committee, anxious, however, to throw as much light upon the subject as their knowledge will permit, and acting, they believe, in the true spirit, in which the society was instituted, beg leave to make the following additional remarks upon the fertilizing effects ascribed to the substances by the donors, namely that their fertilizing qualities, admitting them to be as stated, are conceived to depend, 1st, either upon the nature of the soil to which they are applied, or 2d, upon the properties which such substances possess of attracting moisture from the atmosphere, thereby disposing the earth to the usual operation of nature in vegetation, or 3dly, by their decomposition fur-

nishing the carbonic acid gas.

ice

he

There is a species of vegetable mould, the fertility of which is greatly interfered with in consequence of its containing acids, which opposes the solution of the extractive, &c. which they contain-they are ordinarily called sour soils. By the application of lime or marl, to such soils the product of the soil. In many places, and partition of lime or marl, to such soils the product of the soil. In many places, and partition of which rests ted to this very simple method of analysis, and the soil of which rests ted to this very simple method of analysis, and ed much more soluble. Carbonic acid is also given out during the gradual decomposition of these amenders, (shell, lime, or marl,) which, according to Mr. Henry of Manchester, Senneshies and other wegetable remains. In such solls we according to Mr. Henry of Manchester, Senneshies and other wegetable remains. In such solls we according to Mr. Henry of Manchester, Senneshies and other wegetable remains. In such solls we should avoid as much as possible, ploughing too deep hecause it has been uniformly remarked. and other vegetable principles are thereby renderbier, and others, is an essential pabulum of plants.

Dr. Thomas Thomson, 4th book, chap. 3, treating of the effects of lime, remarks, "Upon the whole then it appears that plants are fed will the fertility of the soil be diminished—this account. Autumn or winter is preferred for this chiefly by that portion of vegetable matter, which becomes soluble in water, and assumes the properties of extractive; that the quantity of it in soils must careous stones, even of very remote formation, as place before it is spread. Marl should always be neither be to great, nor too small: that the in- for example, chalk, which still preserves some dug during the winter, because at this period the

are real and all important, but it is necessary, notwithstanding, to avoid confounding them with are suspended in it, the better is its fertilizing obthose of marl, in all their extent, as it would ject tulfilled. Marls of loose texture and favour-

in many cases to serious results.

The committee, under the direction of the mical and fertilizing properties of these interest-

ing materials.

The application of marl to the fertilization of soils, appears to have been practiced at a very remote antiquity-the Greek and Roman historians speak of it as a very general practice, from tained. Bernard de Pailissy, has published a is referable to the great expense of hauling, and in some cantons or districts, to the slowness of its land seldom reaps the profit of his labour; but it the one, or the other, constituent part obtains. is the holder of the lease who succeeds him, who that the proprietors shall marl the soil.

It is not only upon lands destined for small grain, upon which marl may be usefully spread, but its effects are the same, or even more advantageous upon meadows, pasture grounds, and gardens.

Marls are almost every where found, because clays for the most part contain lime, and sand; and on the other hand, lime is generally combined and on the other hand, lime is generally combined which loss gives the quantity of lime which it with clay and sand, but we can only employ with contained. The quantity of lime being fixed, economy such of the two sorts, as are susceptible of disintegration on expo ure to the air, and more-of disintegration on expo ure to the air, and more-over such as are not too deep below the surface. over such as are not too deep below the surface, or so remote, that the expense of digging and haul-, would be too great; tor in well conducted agrionly, would be too great; for in well conducted agri-culture the expense should always be proportion-sides. This operation is to be repeated until the ate to the probable receipt.

air, and have become mixed with the vegetable re- can readily estimate the proportions in which mains, that they augment the crop or increase the each of the agents exist. deep, because it has been uniformly remarked, employed in working it, and it is to be found on that in proportion as we introduce marl in excess sale throughout the year. In most of the diswith the vegetable matter, so in the same ratio tricts however, the farmers dig it on their own we will explain presently.

Carbonic acid, and probably other gases of the of an acid, by counteracting this change, injures atmosphere, combine with the marl during its the nourishing quality of vegetable mould, and disintegration, but it must be admitted, that in that time is serviceable, partly by neutralising this respect all is conjecture, as we have no positive data from which we can draw conclusions. The result however, of the action, although in-The qualities then of the specimens before us, explicable, is evident, and the longer marl is exposed to the air, or the action of the gases which lead inevitably to disappointment at least, and ably circumstanced, will frequently manifest their powers in a few months.

Marls vary without end in the proportion of Academy, have translated from the Dictionaire their component parts, and of consequence vary de Historie Naturelle, the following interesting to an infinite extent in their effects; and as the article on marls, the production of M. Bosc, as soils also vary, it is almost impossible to give any it presents at once a condensed view of the che-very positive rules for their employment. In the present state of our knowledge, however, the best rules for their application appears to be as follows-1st. we should select those which are the most susceptible of disintegration, by the action of the air, &c .- and 2d. those whose composition is the most opposite to the nature of the soil we wish to which the most advantageous results were oband lime, in equal proportions, are those which distinct work upon the subject, and Olivier de disintegrate the readiest. Thus we prefer those Serres, the patriarch of French agriculture, marls in which lime and sand predomina e, speaks in exalted terms of its effects, and recom- when the character of the soil is clayey: and mends its employment. The agriculturists of on the contrary, we select clayey marl, when the last century combined for the purpose of ex we wish to impart energy to a soil in which tending its use in France, Great Britain and Ger- lime or sand is in excess. Local experience can many, but much is still to be done to render its alone, in this respect, govern the prudent farmer. application as advantageous as is desired. This But there are theoretical means by which he may be greatly assisted; for example, let the principles we have laid down be admitted, we can action, so slow indeed is its action, manifested in readily analyze the soil and the marl, and the resome soils, that the individual who marks the sult assures us, of the proportions in which either

To this end take any given weight, say two derives the advantage. Hence it is that in some ounces, dry it in an oven, and reduce it to powdistricts, the tillers of land require by their lease, der; the powder is then to be put into a clear glass vessel, and a quantity of acetous acid, (vinegar) or nitric acid, (aquafortis) poured upon it, either of these acids will combine with the lime -the mixture must be set aside until settled. The liquor is next to be poured off, the earth left in the glass must be again dried, and we can then a certain by the cale the loss it has sustained, weight of clear water, and agitated or well stirred, for some time. The clay will mix with the water comes off clear. In the bottom of the Coeval with the earliest introduction of marl glass we have the sand, which being dried and up to the present day, experience has proven that weighed, will give the quantity in which it obthey are completely, unfertile of themselves, and tains, and by adding its weight to that of the that it is only after they have been exposed to the lime, and deducting from the original amount, we

rapidly at this period, from the constant humidity acts chemically, and of which not one hundredth food used, the number and kind of stock fed,

and freezing.

It is, perhaps, preferable to spread marl imme diately after it is dug, because by strewing it over the ground, the air acts more readily upon it, from the greater surface that is exposed. When light, and which do not require either sand or thrown out from the marl pits, and permitted to clay. remain in heaps, the access of the air, &c. is prevented, and observation has proven that marls which have not been at first exposed to the air, their properties, which is referable to the oxyd subsequently undergo disintegration with great of iron, and magnesia which they contain. difficulty, and very frequently will not disinte grate at all.

The same motive should also influence the agriculturist, in not permitting the marl to remain in small heaps upon the land, upon which it has been hauled. It should be immediately spread. In the spring of the year, those masses which have escaped disintegration, should be broken down, and their fragments dispersed, the marl should be then ploughed in, or the land lay

ed down in barley or oats.

There are some marls which by boiling readily dissolve, or rather, mix with the water; such however, are not considered the best, as they excess, they can only act mechanically

Since the writing of Bernard de Pailissy, who sought to explain the rationale of their action, to the present day, there has existed much discrepancy in the opinions which have been offer-

ed by scientific men.

made to establish two series of effects in the ac-peated application of manure to such lands that tion of marls, viz: effects purely physical, and effects which result from a play of chemical affinity; and that marls should rather be classed among the amenders of the soil, than among the manures, as many agriculturists have done.

According to this view, clayey marl is supposed to act physically, in rendering the soil to which it is applied, more compact, thereby enabling it to retain the moisture, and the several gases, arising from the decomposition of organic materials, hence it is to calcareous, or sandy tion of gases. 3d. Such lands are very powerfulsoils, which are too light, that the clayey marl

is adapted.

On the other hand, calcareous marls act physically upon clayey soils, or those which are too compact, thus rendering them more permeable to moisture and to the roots of plants.

Both of them again act chemically upon soils, for which they have an affinity, in rendering soluble by means of the calcareous matter which they contain, a greater quantity of the humus, or vegetable mould, which is found in it, and by this means furnishing a more abundant aliment to the plants cultivated in it.

To comprehend this last effect, it is necessary to refer to the experiments of Theodore de Saussure, and Braconnot, experiments which establish, 1st, that the alkalis dissolve the humus totally, and that lime and chalk dissolve a part, and 2d. that plants vegetate with a vigor proportionate to the quantity of the humus which they find in solution with the soil.

These last results, countenanced likewise by a great number of facts, which remain unexplained to the present day, facts which illustrate than 100 acres, reference being had to the why marls when too abundantly applied, frequent ly render soils unfertile for a certain number of the number and kinds of domestic animals years, and why the chalk lands of Champagne are reared, the force employed in its cultivation, destined to an eternal sterility. They teach us the quantity of manure collected and used, also that we should rather marl lands frequently, &c. than apply it at once in too great quantities, using them more sparingly in poor soils than in rich For the most successful experiment in Soilones, and that it is always advantageous to dung ING throughout the months of May, June,

hands are less employed with other concerns of poor lands well before marl is employed; and July, and August, (without the use of grain) the farm, and disintegration goes on much more lastly, that the employment of lime which also with an accurate description of the kind of part is necessary, should always be preferred, the quantity of land so appropriated, together because it acts with greater energy, and its effects can be more readily calculated; above all, raised by the system, in those soils which are neither too stiff nor too

> Marls which are much charged with iron, or with magnesia, should be rejected as unfertile in

A method of employing marl, but little practised, but of which experience speaks very favorably, is to stratify the marl with vegetable matter and manure: this mixture should be permitted to remain for three or four years before it is applied to the soil. At this period almost all the humus contained in the compost is dissolved, and 25 bushels per acre, its fertilizing influence is prompt.

It must not however be dissembled, that although marls give fertility to the soil, they sometimes injure very materially the vegetable product. It has been observed that cattle will not eat the grass of meadows which have been dressed the preceding winter with marl, and Arthur Young contain but little lime or clay; the sand being in his work on agriculture, informs us that potatoes which have been cultivated in lands 'mproved by marl, imbibe from the soil a very unpleasant

From what has been said relative to superficial marling, the conclusion may be drawn that lands naturally marly, are less fertile; such lands are In the "Nouveau cours d'agriculture," in 3 called white lands (terres blanche) marly volumes, published by Deterville, an attempt is lands, (terres marnueses.) It is only oy the rethey are rendered productive. They present or parsnips, with onions interspersed, three very serious objections to their cultivation. 1st. their whiteness reflects the rays of the sun, less than 300 bushels per acre, and consequently the soil is cold; hence vegetation in such lands is retarded. 2d. Moisture or rain, with the subsequent action of the sun, renders their surface hard or crusted, which interferes with the developement of the crops by com pressing the tendrils of the roots They also op pose the introduction of water, as well as the ac ly acted upon by the cold of winter; the frost opens the integrant molcules of their surface and exposes the germs, which causes them to perishwood, artificial meadows or vegetables of summer or fall cultivation, are best adapted to such lands.

00= FOR THE AMERICAN FARMER.

CATTLE SHOW.

THE MARYLAND AGRICULTURAL SOCIETY for the WESTERN SHORE will hold their next CATTLE SHO W, at the Maryland Tavern, on the Frede rick Turnpike Road, four miles from the City of Baltimore, on Monday, Tuesday, and Wednesday, the 25th, 26th and 27th days of October next-for the exhibition of PLOUGHING MAT-CHES, and for the exhibition and sale of Do-MESTIC ANIMALS, HOUSEHOLD MANUFAC-TURES, &c. When the following premiums will be awarded agreeably to the act of incorporation passed at the last session of the General Assembly.

For the best cultivated Farm of not less location, quantity and products of the soil,

with an estimate of the quantity of manure

For the best 20 acres of wheat, of one or more entire fields (to be not less than 25 bush. per acre,) Do. do. Indian corn, yield not less than 50 bushels per acre, 20 do. Rye, Do. do.

than 35 bushels do. do. Hay of Timothy, clover, rye, Do. or orchard grass, or any of the above mixed, to be weighed when well cured, not less than 50 cwt. per acre,

Do. do. 10 acres of wheat not less than

For the best 10 acres of Indian corn, not less than 10 bbls. per acre, For the best 10 acres of rye, not less than

35 bush. per acre, For the best 10 acres of hay, as above, Best crop of tobacco not less than 5 hhds. Best crop of corn and pumpkins, corn crop

to be not less than 8 bbls. per acre, Best crop of 5 acres corn and potatoes, corn crop as above,
Best crop of 1 acre parsnips, not less than

300 bushels per acre, Best crop of 1 acre carrots, not less than

200 bushels per acre, Best crop of 1 acre mangel wurtzel, not less

than 1000 bushels per acre, Best crop of 1 acre mangel wurtzel, carrots

Best crop of 5 acres ruta baga, to be not

Best crop of 1 acre of millet, broom corn, or any other species of maize, reference being had to the weight of fodder and quantity of grain,

In every instance satisfactory evidence as to the cultivation and the product must be exhibited, together with the samples of the crops; also a statement of the time when the crop was sown or planted, and the quantity sowed to the acre.

HORSES. For the best stallion over 3 years of age adapted to the saddle, 15 Do. 2d best do. do. do. 10 quick draft Do. best do. do. 15 Do. 2d best do. do. do. 10 slow draft Do. best do. do. 15 Do. 2d best do. do. do. 10 Do. best brood mare do. saddle 10 Do. 2d best do. do. do. 8 Do. best do. do. quick draft 10 Do. 2d do. do. do. do. 8 Do. best do. do. slow draft 10 Do. 2d best do. do. do. 8 ASSES AND MULES. For the best jack over 3 years, 10 Do. do. jenny do. Do. do. pair well broke mules, 10

CATTLE. For the best bull over 2 years, of country or mixed breed, 15 Do. 2d best do. do. 10 Do. best do. short horn breed do. do. 15 Do. do. do. Devon do. do. 15 Do. do. do. Alderney do. do. 15 Do. do. do. Bakewell do. do. Do. do. do. of any breed between 1 & 2 years, 10 Do. 2d do. do. do. do.

Do. do. milch cow over 3 years of agecertificates of her milking, quantity of butter produced, and keep for 30 days, Do. 2d do. as above.

For the best heifer over one and under 3 years of any breed, Do. do. do. under 1 year of any breed, For the best pair of well broke oxen, re-

ference being had to their performance in the

SWINE. For the best boar over 1 year of age, \$10 Do. do. pig under 1 do. Do. do. bre ing sow over 1 yearspring to be shown, 10 sow pig under 1 year. SHEEP. Do. do.

For the best Merino ram over 1 year, Do. do. of any other breed, pair of Merino ewes. Do. do. do. of any other breed, Do. do.

to be of a single year's growth.

of fifty cents for each pound. FAT STOCK.

For the fattest and heaviest bullock, certicate of live weight to be produced, and the weights when slaughtered of hind quarters, (no ribs attached thereto) fore quarters, head, pluck, and offal, to be exhibited on the first day alive, and afterwards slaughtered and sold in the Baltimore market,

For the fattest and heaviest hog, live weight, &c. as above,

For the best lot of fat wethers not less than six in number.

with the least cost.

DOMESTIC FAMILY MANUFACTURES. For the best piece of broad cloth, 7-4 not

less than 12 yards of any colour, Do. do. Cassimere, not less than 25 yds do. 10 Do. do. Cassinett, Flannel, Do. do. Do do. Carpeting, Do. do. Kersey, adapted to labourers use

30 yards of any colour, Do. do. Linen Sheeting, not less than 25 yds.

of any colour, do. Shirting, Do. do. Do. do. Linen Diaper for table cloths, 8-4 15 yards,

Do. do. do. towelling 7-8 15 yards

Do. do. Hearth Rug,

Do. do. do. do. cotton do. do.

do, Do. do. do. do. thread do. Do. do. grass or straw hat, Leghorn imitation,

IMPLEMENTS OF HUSBANDRY.

For the best agricultural machine or implement that may be considered new, and as deserving of the notice of the society, and worthy of patronage,

For the best flax and hemp breaker, which may be deemed useful and worthy of premium, FERMENTED LIQUORS.

For the sample of the best barrel of cider, of the make of any preceding year, of the pure juice of the apple,

PLOUGHING MATCH. For the best ploughing by 3 horses,

Do. 2d do. do. 3 do. Do. best do. 2 do. Do. 2d do. do. 2 do. Do. best 2 or more oxer. Do. do. do. 2 do. do. do. do. oxen. Do. BUTTER.

For the best butter, the sample exhibited to be of a churning of not less than 5 lbs. and

About believe, not common the first year. This piece in botany Maranta, a genus of the monandria sible, for the reception of the grass seed. About believe, not common the first year. This piece in botany Maranta, a genus of the monandria the tenth of September, the seed was sown at the afforded at least a ton of hay, and I am in hopes monogynia class, is a native of the West Indies, rate of eight quarts to the acre, and lightly covered, by raking the ground carefully over, by hand, with an iron tooth rake. This operation was performed by one man, in a day and a half. Ahout the twentieth of October, the corn was sufficiently ripe for cutting up by the ground, in the manner frequently practised, so as to make an excellent fodder, and yet the corn to ripen on the stalk. It was removed into an adjoining pasture on a sled, and stacked in such form as to cure without becoming mouldy—at this time, the lot was quite green, with a vigorous growth of young "herds grass." The corn was not measured, but estimated to be at the rate of forty bushels to the acre, after furnishing my own family, and several of my neighbours, with many delicious meals, while in the proper state for roasting and boiling. After the potatoes were dug, the ground which they occupied was levelled with the rake, and sowed with grass seed. It had sufficient time to vegetate, before the hard weather commenced, but was injured by the severe frosts in the winter months, its young roots being too tender to resist repeated freezing and thawing. The rate of eight quarts to the acre, and lightly co- will not injure the next crop. vered, by raking the ground carefully over, by

The produce of the lot in 1822, stands thus,

2 tons of hay. 2 tons of fodder. 40 bushels of corn. 5 bushels of potatoes. 1 do. of beans. S cart loads of pumpkins.

One of my other lots is occupied for pasturage,

occasions too great a growth of vine, though by winter months, its young roots being too tender to resist repeated freezing and thawing. The latter part of March, the lot was carefully examined, and where any spots were found injured or killed by the winter, fresh seed was scattered and covered as before with the rake. The spring months were favourable to its growth, and the fore part of July, 1823, the grass was cut, and afforded three tons of excellent hay. The crops was so luxuriant and tall, that it began to lodge, or fall down, by the middle of June. The ground is now covered with a heavy coat of fall growth, although two cows were pastured on it for six or eight weeks in the autumn; and should this year be favourable to vegetation, I have no doubt of cutting at least four tons on this small piece of an acre and a third.

The usual mode of cultivating such lands by two or three crops of corn or grain, before seeding, I was unwilling to comply with, as I could not spare my meadow for so long a time; this difficulty is so far overcome as to afforded this difficulty is so far overcome as to afforded this is sidficulty is so far overcome as to afforded this is state, is wheat—it is so fitself a remedy; and in dyspeptic cases, and acute diseases, it constitutes the most cafforded there cons. Of some the match is a fact, and hemp yield excellent crops.—Of some the match is so fitted the most capte trief, in fact, and hemp yield excellent crops.—Of some the match is a fact, and hemp yield excellent crops.—Of some the match is a fact, and hemp yield excellent crops.—Of some the match is a fact, and hemp yield excellent crops.—Of some the readily accommodate itself to afford the radie file did rink, no article of the match is a fact, and a barley success the most view of the match is a fact, and successes and acute diseases, it constitutes the most capte and core of some other readily so afford the readily accommodate itself to afford the readily accommodate itself to afford the readily accommodate itself to afford not spare my meadow for so long a time; this five or six years old, when they bear the cold of vation, that they should be buried at least one led me to make trial of the above course, where our winters without flinching. But should I go foot in some dry and warm spot. The preparaby I have accomplished all I had in view, namely, on to describe all the productions of this beauti-

50 LUCERNE, ITS VALUE AND MODE OF CULTURE.

[We have long been persuaded, that the public are not generally sensible of the great value of Lucerne, in comparison with other grasses, for green food, especially in hot and dry seasons, and we are the more gratified in the opportunity of copying the following communication, to the Philadelphia Agricultural Society, founded, as it purports to be, on the experience of ten years. The seed may, we perceive, be now had, of Mr. Robert Sinclair, at 50 cents per pound.]-Edit. Am. Far.

TO THE PHILADELPHIA SOCIETY FOR THE PROMO-TION OF AGRICULTURE.

Berth Amboy, 10th July, 1823. Having been for eight or ten years past in the successful practice of cultivating lucerne, I think it may beneficially promote the interest of Agriculture, to offer you a few remarks on that subject.

This article, (frequently denominated French Clover,) I have found by experience, to be not only the most convenient, but also the most profitable of all grasses. It vegetates quicker in the Spring than any other grass, it resists the effect of droughts, it may be cut 4 or 5 times in the course of the season, and it will endure from 10 to 12 years without renewing. Of all other grasses it is the most profitable for soiling. I am fully of opinion, that one acre properly got in would be more than sufficient to maintain at least 6 head of cattle from the first of May, until the frosts set in, for before it can be cut down in this way, the first part of it will again be ready for the scythe. English writers have recommended the drill system for this grass, but in this climate I have found this plan not to answer.

The proper mode is to put the land in good order; to sow it broad cast, and to get the seed Esteemed Frie d. in during the month of April, or the early part of May. Fall sowing will not answer, as when with Spring rye, or barley, or with oats, but in them. the last case, the oats would require to be cut would most confidently recommend, would be to when partially dried, the cattle ate greedily. sow with the lucerne, about half a bushel of com-

quence of the toughness of the outer coat, it mon (winter) rye to the acre. The effect of this planted in drills; there was about a table-spoon would be advisable to perform the operation as is, that the rye, which vegetates quickly, serves full of seed received by me; and I gathered about speedily as possible after digging. As soon as this as a nurse to the young grass, against the effects seven quarts of beautiful white seed, although the is effected, grate the roots in a clean vessel of of the scorching sun, and by the time the grass birds destroyed at least one third of it this year, water—then pass the contents thereof through attains sufficient strength to protect itself, the I had intended to have sown it broad cast, but I a sieve—this must be repeated, taking care to rye withers and apparently dies. It will howechange the water at every successive trial, so ver again come forth in the spring, and mixed with
long as any coarse particles remain in the sieve. the lucerne, will add much to the quantity of

The blue corn (from Thomas Ellicott, Jr.) ri-The water is then allowed to settle, and if it ex- fodder, and prove a most excellent feed for catment is in a fit state to be dried, which should be this way, (before getting into seed,) two or three done, if possible, in the sun, and in a confined times with the lucerne, before it decays. The situation, where no dust can reach it. To a ta- quantity of seed I recommend, is at the rate of by Mr. Brown) I had the misfortune to have root-15 to 20 pound to the acre.

The kind of soil most suitable for this culture to which add a little nutmeg and sugar, and you is a dry mellow land-but a sandy or clay land will then have a jelly, pleasant as it is healthful. will also answer, provided they are not wet. In a favourable season, the lucerne may be cut the H. Rose's farm, in the above county, very luxuriensuing fall-after the first season you may generally begin to cut it green for cattle by the first produced with him 136 bushels per acre; it was of May, which saves the young pasture, and is in every respect a great convenience, as hogs and meet the eye of all our readers, and if any of every description of animals devour it with equal and I counted on an average from 15 to 20 ears on avidity. It produces a great quantity of seed, and is much more easily obtained than clover. The second and third crops are the most productive of seed.

JOHN PATRICK.

[The liberality of our correspondents, in sending us seed of rare and valuable plants and grasses, has enabled us to distribute a great variety for experiment, in all the climates and soils of our extended country. It has given us pleasure to believe that in this way we have been the willing medium of diffusing some practical benefits, but that pleasure has been alloyed by the neglect of those to whom these seed have been given for experiment, in not making known the results. This has been promised in many instances, but very rarely performed. To con-tinue to send such things when trial has proved them to be unprofitable, would be labour in vain, from which we have a right to be exonemake offerings in this way for the common benefit, should desire to know whether their wishes have been realised; and it is, moreover, a courtesy due to their publick spirit and disinterestedness. We shall hereafter endeavour to keep a register of all to whom seed and other things are sent, and if we do not note those who fail in making the return here exacted, we shall at least make known the information we derive from those who make experiments and proclaim them, for the publick benefit as well as for their own use.

t is under these impressions and views that we give the following extract from a worthy friend in Pennsylvania.]-Ed. Am. Far.

RESULTS OF EXPERIMENTS

In Pennsylvania, with Egyptian Millet, various Corns, &c. and offering of Corn, Guernsey, Parsnips, Mercer Potatoes, &c.

TO THE EDITOR OF THE AMERICAN FARMER

I must acknowledge my negligence in not re turning my thanks for the many parcels of seeds sowed so late, it, like clover, is found not to re-thee has sent me; but I think I am now prepared sist the effects of the frosts. It may be got in to give an account of the success of the most of

the last case, the oats would require to be cut The Egyptian millet grew to the height of from green and before getting into seed, and by this ten to twelve feet, but the season was too short means, an early feed for cattle would be obtained for it to ripen; it was astonishing to see the a without impoverishing the soil. But the mode I mount of provender from a single seed, which

The parcel that was simply styled millet, I

The water is then allowed to settle, and if it ex-hibits a clear and natural appearance, the sedi-tle. The rye will admit of being cut green in those that are fond of obtaining boiling ears a lit-

The corn from Brazil (brought and presented ed up by some small long-faced gentry.

The corn from Susquehannah county, produced more fungi than corn; and will require a few years to naturalize it; I saw it growing on Robert antly, and I have not the least doubt but that it planted I think, 3 feet apart one way, and 18 inches the other, two to three grains in a place, a hill; it has ears from the lower joint to the second from the top; I cannot but remark that I have not seen in my travels any upland so productive in corn, and grass, and I may add wheat, rye, oats, and flax, as Susquehannah county; it will become the best section for sheep in the states; containing beautiful seats for Factories.

The ice rined melon seed I have not planted. The wheat came too late for this season.

I send by the bearer, my Father, some red-cob gourd seed corn, which produced for me last season 71½ bushels per acre, on six acres; it is a mixture of the red-cob flint, and the genuine gourd seed, and has been carefully selected for many years-three half bushels of ears will make more than a bushel of corn, in consequence of the smallness of the cob; some men are very particular in lessening the bone of their feeding animals, and forget to observe the same nicety in regard to their cobs.

I also send some guernsey parsnips, which for rated; and besides it is natural that those who flavour, smoothness of skin, and fine shape, excel any thing of the kind that I am acquainted with; they shoulder up at the top, like a good Dishley sheep.

I forward too, some Mercer potatoes, which I was astonished to find were not to be found in your market; I do believe that if I had 1000 bushels, and that they were the only ones to be found, with the present credit they bear in Philadelphia, that I could obtain my own price for them. This is at thy service.

I remain with respect, thine, &c. JOSEPH KERSEY.

Downington, 3 Mo. 23d, 1824.

TO THE EDITOR OF THE AMERICAN FARMER. March 19, 1824.

-0-

DEAR SIR,

Altho' I must acknowledge that you have had enough lately to sicken you with the Politicks of Agriculture, yet I must take the liberty once more to introduce them, (at least incidentally,) to your attention. A correspondent of yours from Frederick County, in Maryland, has lately conferred upon me certain favours in your paper, which I trust you will permit me to endeavour to return.

As he begins and ends with complaints and grievances, I have not much hope that I shall be able to say any thing which may change his cone; although an effort shall not be wanting, to do so. In the first place he censures my name of "Ruris Consultus," as "unfarmer-like;" and then im-Consultus," as "unfarmer-like;" and then immediately follows the example he condemns, by adopting for himself that of "Philo-Hamilton:"— mer, either in sound, or in nature, as any which this county. His practice was always to give his parts likely to be affected, it would answer the the most fanciful imagination could invent. He horses, particularly while in the stable, an handful purpose; I cleaned a number of trees, and put a next gives us an epitome of his losses and crosses, of salt once a week to each horse. This practice coat of lime mortar, about \frac{1}{2} an inch thick, round the all of which are most conveniently charged to I have followed on my farm for twenty years, and body, then drew the earth up to it. These trees Government account; although for aught that I never saw one of my horses afflicted by botts, are now perfectly healthy, and there has not the public can tell to the contrary, they may I am also a considerable breeder. As a feed for been the sign of a worm about them since, alhave been justly attributable to the same greedy, young stock of that kind, I make great use of though it is about five years past, that the eximprovident, and miscalculating spirit, which, durcarrots, and I see none that look better or have periment was made.—I have since tried the same ing the late war, ruined so many other builders better growth than my own. of air castles for manufacturing. However, since he speaks of his disasters in so risible a humour, we may spare our sympathy for the misfortunes of a gentleman who appears so well able to do

In his predictions respecting the projected tariff, I hope for his own sake, that he is mistaken; since to have a man's fingers and his wits " a woolgathering" at the same time, would be rather more labour, I fear, than he could well perform -however solicitous he may be to engage in this twofold occupation. As for "the Crisis" which your correspondent seems to suppose, was written specially for the edification of President Munroe, by that most edifying of all writers, Hamilton; I must inform said correspondent, that I have actually read it through; and have found it to be little else, than a mere transposition of the same phrases and calculations, with which the same author has again and again dosed the public for the last four or five years; and which have been as often exposed and refuted to the satisfaction of every man in the nation, except the would-be "wool-gatherers" at the public expense, and their coadjutors. Be this, however, as it may, I acknowlege myself much indebted to Philo-Hamilton for his very friendly and gratuitous sugges tion in regard to the nature of my future studies but particularly so for his advice to read that most rare and precious pamphlet, the Crisis, as it is obvious he designs it all for my good. The reason he assigns for these kind admonitions, consider a still stronger evidence of his regard,viz: "because I appear to him to shed my ink more for the purpose of convincing myself, than others." Truly, if he has made as many notable and ingenious discoveries in the science of agriculture on his "thousand acres," as this is in the science of mind—to say nothing of the matchless feat which he has performed for that of Politica Economy, he shall have, at least my vote to be henceforth installed our Magnus Apollo:—and to hold the office, -not durante bene placito, but for

One word more, Mr. Editor, and your friend "Ruris Consultus," with the "unfarmer like name," bids you adieu forever. I observed in the very next article to Philo-Hamilton's most vivacious letter, that the first words were "Wild Geese!!"—Will you be candid enough to tell an old subscriber, whether this was merely an accidental juxta position, or one of those apparently fortuitous readings which has more meaning, than meets the eye.

Your constant reader and friend, RURIS CONSULTUS.

TO THE EDITOR OF THE AMERICAN FARMER.

a name surely, as little resembling that of a far- and he was one of the most extensive breeders in length I concluded, could I completely shield the on a great number of trees with equal success. Thou wilt communicate this to thy neighbours in such way as thou mayest think proper, as I wish it universally known.

Thy Friend, WILLIAM SHOTWELL. JAMES A. BENNET, Rahway.

From the Philadelphia Daily Advertiser. MR. POULSON,

A writer in your paper wants to know the Chinese method of propagating fruit trees .- A volume before me contains the following :- " The ingenious people of China have a common method of propagating several kinds of fruit trees, which has been practised with success in Bengal; they strip the bark off in a ring about an inch in width, from a bearing branch surround the place with a ball of fat earth or loam bound fast to the branch with a piece of matting; over this they suspend a horn with water, having a small hole in the end, just sufficient to let the water drop, in order to keep the earth constantly moist-the branch, throws out new roots into the earth, just above the place where the ring of bark was stripped off. The operation is performed in the spring, and the branch is sawn off and put into the ground at the fall of the leaf. The following year it will bear fruit."

>0 AN ACT

Directing a geological and mineralogical survey to be made of the State of North Carolina.

Be it enacted by the General Assembly of the State of North-Carolina, and it is hereby enacted by the authority of the same, That it is hereby made the duty of the Board of Agriculture of North-Carolina to employ some person of competent skill and science, to commence and carry on a geological and mineralogical survey of the various regions of this State; and that the person or persons so employed shall, at stated periods, furnish to the Board true and correct accounts of the results of said surveys and investigations, which shall annually be published by the Board aforesaid, for the benefit of the public, as provided by the sixth section of the act of the last General Assembly, entitled "An act to promote Agriculture and family Domestic Manufactures within this State.

II. And be it further enacted, That for the pur-5,833,000 pose of carrying the intention of the foregoing 6,840,000 section into effect, a sum not exceeding two hun-1,900,000 dred and fifty dollars, be, and the same is hereby 797,000 annually appropriated for four successive years, out of the unexpended balance of the agricultural Total, \$70,656,500 fund, as created and set apart by the above recited act; and that the Treasurer of the State is hereby directed to pay the same to the order of the Board of Agriculture of North-Carolina.

[What is hereby wisely ordered by the State of North Carolina, has been done in the State of New-York by the munificence of an individual, Gen. Van Ransellear.-Quere? when will the Lepaper, as I see the subject incidentally mentioned in one of your papers on the botts in horses. I calarly regretted the loss of our peach trees, by to the development and augmentation of the ine

90 CUMBERLAND AGRICULTURAL SOCIETY.

Fayettville, March 11, 1824.
The annual meeting of the Cumberland Agricultural Society, was held in this town on Monday and Tuesday of last week, and agreeably to

the provisions of the constitution of the society, requiring the election of officers, the following officers were duly elected for the ensuing year:

John A Cameron, President. John Hodges, and \ Vice President. L. Bethune, James Seawell, Secretary. John Matthews, Treasurer. John Black, John Smith, Henry Elliot, Stewards. Josiah Evans, Daniel M'Lean, Neil M'Neil,

The following resolutions were then adopted: Resolved, That the sum of \$120 be placed at the disposal of the Board of Managers for the ensuing year, to be distributed by them in premi
ship Lancaster, West Philad. May 22, 1818, Arr. do. do. June 25, 1819, Arr. do. Burkhart u.ms, for the best specimens of such articles of domestic manufactures, as may by said board be upon by the Board of Managers.

Resolved, That the President be requested to deliver, on the day of said exhibition, a suitable address.

The meeting was punctually attended by the President and Vice President, and most of the other officers, as well also by the members genethe promotion and advancement of the great ob-

[Observer.

QUICK VEGETATION FOR THE SEASON.

Richmond County, Va. 22d March. 1824. On the 30th December, I sowed garden peas, and they were discovered to be up on the 11th January, they were sowed in the open garden, but after Cobbett's plan of digging a trench 5 or 6 inches deep, and filling of it nearly full with stable manure on which a little rich mould was put, and the peas sowed on it and covered three or four inches deep. With the mould, and a covering of pine brush over that, they have stood the winter without the least injury, and are now eight J. D. or nine inches high.

FROM THE NEW BEDFORD MERCURY.

LIGHT! MORE LIGHT!

Mr. Printer,

I am persuaded from the little observation I have made, that the prejudice existing against an oil light, arises almost entirely from the ignorance of the person who trims the lamps. To produce a good light from oil, the inside of the lamps should be perfectly clean, and the vent hole at

spring, either on the Long Island, Baltimore or it otherwise would. In fixing the wick care should and the subjects presented for discussion being of Washington courses, agreeably to their respective be taken that it be only large enough to sustain importance to the society, received corresponding rules; or he will run against him at either of the itself in the tube-if it is too large, the oil will attention. The committee previously appointed above places, and each horse carry such weight as the owner may think proper. In the black crust should be cut off port, which was canvassed by the board, and its from the wick every day, and it should not then details modified and finally arranged as now pubbe raised too high, as it will smoke, or spread lished. Engrossed by the various interests and out, as I have often seen done, as that will cause objects of their institution, and cheered by the it to crust very soon, and the flame will soon grow pleasures of conversation, and the interchange of

Facts deserving attention in this community.

In Salem, Massachusetts, the Poor House is a source of income to the amount of 1,300 dollars per annum.-In Quincy, Massachusetts, the labour of those of the poor who were able to do any thing, not only supported the sick and infirm, but also paid the interest of a debt contracted for the erection of a suitable house, and every year a part of the principal of that debt.

The passages of the ship Lancaster, of this port, having recently been the subject of discussion, we have, for the sake of accuracy, obtained the following abstract of the periods occupied in making three different voyages from land to land. Liverpool, Dec. 25, 1817—Arr. ship Lancaster, West Philad. Days Hours.

17 12 15 15* 16 0

* A passenger in the ship on this voyage, wrote deemed advisable; the exhibition (or show,) to to his friends at home whilst off New Castle, and be held at such time and place as shall be agreed again wrote to them from Liverpool, after a lapse of only sixteen days.

TO THE EDITOR OF THE AMERICAN FARMER.

Frederick County, March 24, 1824.

SIR,

The enlightened agriculturist and distinguished rally; and all manifested much laudable zeal in breeder of cattle at Powelton, in Philadelphia county, has favored the public through your Ameject of the society—Agriculture.

The agricultural show and exhibition, will be digree of his "improved short horn stock," and held at Meadow Branch, on the farm of John A. at the same time mentioned their valuable pro-Cameron, Esq. adjoining this town, on the 4th and 5th of November next. A list of the premiums, &c. will be published in our next. rable to know, how much milk per day his cows will give on an average, say in two or three weeks after calving, and when six or eight months in calf; as to their being beautiful animals, and arriving at early maturity, we already have sufficient testimony, but from appearances, some sur-prize is felt at their being "deep milkers, and small consumers."—Mr. John P. Milnor, assistant recording secretary of the Pennsylvania Agricultural Society, says, in a letter addressed to you 3d. inst., that Mr. Powel's short horn heifers fed upon mangel wurtzel roots, "yield very large quantities of milk, affording the richest cream he ever tasted."—It would be satisfactory to know how much this very large quantity was per day, and if Mr. Milnor ever saw or tasted cream from Mr. Haine's Alderney cow-

TRUSTEES MEETING. THE LAST AND THE NEXT.

The last monthly meeting of the Board of Trustop always open and free from dirt. The oil tees of the Maryland Agricultural Society was pulace-stimulated to partial rebellions by leaders

"A Southerner," whose name is left with the ought to be clear of sediment. If the tube for held agreeably to adjournment at Eutaw—the editor of the Philadelphia Democratic Press, of-the wick runs down into the bulb of the lamp, it residence of B. W. Hall, Esq. The attendance was fers to run a horse against Eclipse the ensuing will heat the oil, and cause it to burn freer than almost unanimous, and punctual to the hour fixed, agricultural opinions and views, the day glided swiftly away, and the Board finally adjourned to meet on Wednesday the 7th of April, at the residence of Jacob Hollingsworth, Jr. Esq. on Elk-

It was decided that the Trustees make return of the amount of their subscription lists, to the Treasurer of the society, before the June meeting.

Judges are yet to be appointed for the several objects for which premiums are offered, and measures ought to be taken without loss of time, to renew the application to the legislature, for a donation for a limited time.

ITEMS OF NEWS.

NAVAL .- Com. Porter, in the John Adams, has arrived off St. Barts, after a boisterous passage, he stops there to enquire for Spanish and South American privateers, pirates, &c. &c. and will scour the West Indies in his way to Key West. This gallant officer now commands all our naval forces afloat, except those in the Pacific and Mediterranean Seas.

The U. S. ship Peacock, Capt. Carter, sailed from Hampton Roads on Thursday last, to join the squadron in the Pacific.-Lieut. Kennon, attached to the Frigate United States, Capt. Hall, goes passenger in the Peacock, after having been honorably acquitted by the court martial at Norfolk. Capt. S Smith was tried and cashiered for conveying merchandize on freight, in a national vessel, but has been restored to the service by an order of the President, the court having recommended him to the Presidential clemency. Lieut. Weaver, of the navy, has been cast in a suit against certain merchants in New York, after receiving from them more than \$12,000, under a contract to go in a merchant ship to Lima, and to pass her under the protection of the Franklin 74, as her store ship. Congress have passed a law to divide the commissions arising from the transportation of specie in national vessels, into thirds, between the captain of the vessel, the other offi-cers, and the navy pension fund. The Secretary of the Navy, has issued an order, prohibiting under certain restrictions and limitations, the arrest of officers within the United States; which order is calculated to diminish the number of vexatious and expensive courts martial, and courts of enquiry. A bill to reorganize a naval peace establishment, has been reported in congress, creating two new grades-that of Vice-Admiral and Rear-Admiral, which are just as necessary and proper, as a Colonel to a Regiment, or a General to a Division -it's only the name that offends-sound is often confounded with sense-then call them Incas, or any thing else, only ensure us the practical effect of appropriate grades and due subordination.

FOREIGN .- England is at war with the Algerines -this war will probably not be of long duration or great extent-it may compel her to fit out an expensive expedition, and then the Turks will make peace-and then-they'll break it again -In Spain, all is despotism and darkness-discontent and bloodshed—a king without talents or humanity; a venal soldiery, without any love of country-a priest-ridden, degraded, and ignorant posion in the House of Representatives-two of the most distinguished members, P. P. Barbour, and H. Clay, have spoken; the first against, the second in favour of the general principles and policy of the bill .- Its fate is doubtful, and its tendency of the utmost concern to the nation .- The congressional committee on agriculture, have reported against any particular measure on the subzils, who is the son of John, King of Portugal .the mean time, holds on as a mere locum tenens, exclain triumphantly,

B. IRVINE, a citizen of the United States, has arrived at Laguyra, from Curracoa, after a barbarous confinement of sixteen months, without any sort of remuneration or redress—He was liberated by a direct order from the King of Holland, without trial, on the ground that he had not violated directly or indirectly, any law of Hol-

would probably render to their agricultural reaminish the demand for the Farmer, and the numeach week with great care, labour, and consumpwhile it is most laborious, most emphatically falls next square only, giving our table of contentsfeelings and sense of what is fair and right.

NATURAL HISTORY.

RABBIT, CUNICULIS, IN ZOOLOGY.

The extent of rabbit warrens in England, where, their man gement, we give sketches from Engand curious remarks of Mr. Hardin, on the habits of that animal.

Near Shelbyville, Ky. 6th March, 1824. TO THE EDITOR OF THE AMERICAN FARMER. Dear Sir,

When we become subscribers to the Ameri

And should any speculative theory appear in your columns, it is then either of us (whose expe rience conflicts with such theory) is substantialimpression (and not from a spirit of contradic-tion I assure you, sir.) do I give you some of the This too ma theory of Doctor Macaulay, in your 40th No. of more plausible, tested by experience, and carry-vol. 5, wherein he concludes that "the male rabing with it more of the rational." "bit destroys the young, for the sole purpose of "enticing the embraces of the mother."

Whilst I resided in Frankfort, I procured the white, the black, the gray, and the blue rabbits. out entirely vellow, or copperas coloured. As tion respecting warrens, and I have never seen and they were a rarity with us, I was not inattentive answer to it, of course if he is not better supplied, to their babits, and all that I relate of them is what I have said is intended for his benefit. from personal observation. From the entire level of my lot, there was no bank, or hill side for them to burrow in, of course their cells were frequently deluged by rains, and their young drowned; to protect them from this casualty, I wort and cabbage-leaves, carrots, parsnips, ap frequently dug down to the extremity of the hole, ple rinds, green corn, and vetches, in the time of rains. I castrated most of the males when young, but with these moist foods they must always have so that at all seasons of the year, they were fit for table use: to distinguish the stags, I always split one of their ears, so that I might not be mistaken in catching them. Although I have never had an hundred at a time, yet I have had upwards of ninety. Like all domestic animals, they may be taught to come to food by any par ticular sound—I chose a peculiar kind of whistle between the hands, and by shelling corn around would throw them into a dropsy. At all other thands are the same of the dropsy are a proportionable quantity of the dry foods, as hay, bread, oats, bran, and the like, otherwise they will grow pot bellied, and die. Bran and grains mixed together have been also found to be very good food. In winter they will eat hay, oats, and these may be given three times a day: but when they eat green things, it must be obtive in the hands, and by shelling corn around would throw them into a dropsy. At all other they are not to drink at all, for between the hands, and by shelling corn around would throw them into a dropsy. At all other, could take by the ears any one of them with-times, a very little drink serves their turn, but out disturbing the rest. I would advise a south-that must always be fresh."

They begin to breed at a year old, sometimes bed; she then closes the mouth of the hole by re- and sweetest hay that can be got, of which one sconer; and multiply five, six and seven times turning to it part of the dirt, and pressing it down load will serve two hundred couples a year; and a year, having from four to eight at a litter, with her fore feet, so as to leave no appearance out of this stock of two hundred may be eat in thus increasing so rapidly, that to say that of the hole. Just before parturition, she opens the family, two hundred sold to the markets, and werbially, the idea of great fecundity.

When the buck approaches the doc, he first beats

When the buck approaches the doc, he first beats

The other general disease of these creatures is securely covers the hole, and runs in search of a sort of madness: this may be known by their and stamps very hard with his feet, and after embracing her, falls backwards and lies motion less, as it were in a trance; in this state he may be readily taken, but he soon recovers from it. open the hole, go in, and uniformly in two minutes of the keeping them low, and giving them had a sort of matthes. This may be known by their heels wallowing and tumbling about with their heels opposed to he owing but once in twenty-four hours, unless it is in the boxes. This distemper is supposed to be owing by their heels. This distemper is supposed to be owing boxes of their feeding; and the general open the hole, go in, and uniformly in two minutes of the keeping them low, and giving them in some districts many hundred acres in a body by the watch return, close the hole securely and the prickly herb, called tare-thietle, to eat." are appropriated to the raising of rabbits for leave it. I have then by removing the box and "The general computation of males and fesale, would appear surprising to those who had examining the young, found them quite full. In males is, that one buck rabbit will serve for nine never adverted to the subject. As enquiries about three weeks she leaves a small opening at does; some allow ten to one buck: but those have been made by correspondents relative to the mouth of the hole, the young then occasion-the proper construction of rabbit warrens, and ally come out, in a few days more she closes the hole when they are out, and when they are thirty lish authorities, which follow the interesting days old she has a new litter. When I have wanted to use the young for broiling, I have at the time of parturition, and for some time after kept the mother secluded from the buck, so that she might suckle them a few weeks longer .- If these statements be true, Doctor Macaulay's supposition is without foundation. So much for facts, take my conclusions for what they are worth-my can Farmer, I consider it a tacit admission, that own conclusion has been, and still is, that at par-we belong to the same social compact, and that turition, the mother leaves with the bed of young our general experience is a kind of common pro exactly the kind of odour, which accompanies perty, upon which you have a right to draw her to the buck, after the first caresses she perty, upon which you have a right to draw her to the buck, after the first caresses she whenever you may think it beneficial to its mem-plays the coquet and hides from him; in his search for her, if he comes to the bed of young, to which he is guided by the scent, unless they couple an acre at 2s. 4d. are very secure) he scratches them to pieces, not from motives of destruction to them, but to drive is called on to contribute his mite Under this the doe (which he believes there hid) from her

This too may be a speculative theory, and I habits of the rabbit; which at once overturus the can have no objection to its being put down by one

Respectfully, yours,
MARK HARDIN.

P. S. You may think strange that I have gone so much into detail. This is my apology-long and after a few years, some of the offspring turned since some of your subscribers called for informa-

VOL. 6.-3.

in a small artificial warren, in a lawn in the garden, made in the following manner.

" Pare off the turf of a circle, about forty feet diameter, and lay it on the outside; then dig a ditch within this circle, the outside perpendicular, joyment of as fine weather as December ever the inner sloping, and throw earth sufficient into the middle to form a little hill, two or three feet Yard where this assemblage of choice stock is higher than the level of the lawn; the rest must sheven, is admirably adapted for the purpose; be carried away. Then lay down the turf on the it admits of a perfect arrangement and classificahill, and beat it well to settle The ditch at bottion; and no pains were spared by the Proprietom should be about three feet wide, and three tors to render it in every respect safe and agreeand a half deep, with two or three drains at the able. Since the removal of the implements to grass, hay, and 170 oil-cakes. Travelled 72 miles. bottom, covered with an iron grate, or a stone with the spacious lofts, the whole area is free for the holes, to carry off the hasty rains, in order to exhibition of the animals-and at the same time and 8 months old, bred by Mr. John Jones, and keep the rabbits dry. In the outside bank should there is ample roof for the company: even ladies fed by Mr. Rowland, on grass, hay, Swedish turbe six alcoves, the sides and top supported, either graced the Yard with their presence, and passed nips, and oil-cakes. Travelled 46 miles. by boards or brick work, to give the rabbits their along without the least inconvenience or danger. dry food in; by their different situations, some The gratification has been, we are happy to say, will always be dry; six boxes, or old tea-chests, without alloy, whether as regards the public or and fed on bean-meal and oil-cakes. Travelled let into the bank, will do very well. If the ground the candidates; and on no former occasion have 73 miles. be very light, the outside circle should have a wall built round it, or some stakes driven into the ground, and boards or hurdles nailed to them, arduous task till late on Thursday evening, yet within a foot of the bottom, to prevent the bank early on Friday morning, long before day break, from falling in. The entrance must be either by the early visiters, persons who are called by their a board to turn occasionally cross the ditch, or business to Smithfield, found the Yard brilliantly by a ladder. The turf being settled, and the lighted with gas; the labels descriptive of the grass beginning to grow, turn in the rabbits, and animals all up; and every arrangement complete. they will immediately go to work to make them. Thus prepared, the Stock came under review as selves burrows in the sides, and in the hill. By follows:way of inducing them rather to build in the sides, about a foot deep, and they will finish them to ing:—
their own mind; and if there be a brick-wall To the Marquis of Exeter, for his Durham ox, their own mind; and if there be a brick-wall To the Marquis of Exeter, for his Durham ox, Mr. George Tibbits, a Scotch ox, 4 years old, round it, it should be built on pillars, with an 2 years and 11 months old, the prize of Twenty fed by him on grass, hay, and 370 lbs. of oilarch from each, to leave a vacancy for a burrow." But there is, he says, another way that may be Class 2.—For oxen or steers of a practised, which is, "to dig the ditch only about age, weight 160 stone and upwards: two feet deep, which will yield about earth enough to make the hill; put some pales, about a foot 5 years and 8 months old, bred by Mr. John Jones, high, on the outside, for that will be a sufficient and fed by Mr. Rowland, on grass, hay, Swedish ably fine, an unprecedented number of visiters height to keep the rabbits in. Feed them as other turnips, and 2250 lbs. of oil cake, the first prize tame rabbits are fed; and in wet weather sprinkle of Twenty Guineas.

saw dust at the bottom, by which means the To Mr. Richard Kitelee for his Hereford ox, saw dust at the bottom, by which means the quantity of manure will be increased; once a under 6 years old, bred by Mr. James Lee, and week is often enough to take it way; the quanti fed by Mr. Kitelee on grass, hay, turnips, and the stream was impossible:—the fame of the ty will be surprising, nor will the smell be in the 1500 lbs. of oil cake, the second prize of Ten stock had gone abroad, and the curious of all least offensive, even though it be quite close to Guineas. the house. In a very large lawn, two or three of these hills, with the rabbits feeding on the tops, age, under 160 stone, and above 110 stone weight: will not be unpleasing objects. If the bucks happen to be mischievous in killing the young ones, they must be chained in an alcove; or else have their liberty as in a warren. After a great snow hay only, the first prize of Fifteen Guineas. they will want some assistance early next morning; because the ditch will be nearly filled, and

He adds, that "it is a great improvement to Guineas. eastrate the young bucks, and keep them till they are full grown, before you kill them; the flesh A Scotch ox, 4 years old; a Durham ox, 3 years dairy milk pans, turned, and tinned inside. They numerous, and disturb the breeding does; or else and 9 months old have a few hutches in the alcove to fatten them [Here follows account of prizes awarded for long

SMITHFIELD CLUB-CATTLE SHOW.

readers.

The pleasing duty of reporting this Annual the above head. Meeting has again come round, and we are happy to observe that, in the number of excellent ani mals, and the general merit of the stock brought forward on this occasion, the present Exhibition has never been surpassed. The interest it excited Travelled in canal boat 150 miles.

animals with much success and ornamental effect was indeed evident in a two-fold manner :- first, by a sufficient competition in every class, and the consequent adjudication of all the Premiums: and, second, by a numerous attendance of visitors of all ranks, who had likewise the additional enproduced. It has been before observed, that the we perceived more unanimity and satisfaction.

Though the Judges were not able to finish their old, ditto, ditto.

OXEN.

Class 1 .- For steers or oxen of any breed unto keep the turf the neater, make a score of holes der 36 months old, without restrictions as to feed-

Guineas.

Class 2.- For oxen or steers of any breed or

To Mr. Richard Rowland for his Hereford ox,

Class 3.-For oxen and steers of any breed or

To Mr. Wm. Draycott, for his Hereford ox, 3 years and 10 months old, bred by Mr. James of the implements, seed and roots, exhibited in Cooper, and fed by Mr. Draycott, on grass and the light and spacious lofts over the Yard.

To Mr. James Senior, for his Hereford ox, 3 as the following.] years and 9 months old, bred by Mr. Thomas Messrs. Lees, perhaps the alcove, where the hay is, will be Tomkins, and fed by Mr. Senior, on grass, hay, iron chaff-cutter (on Salmon's principle); two blocked up."

will be amazingly finer, whiter, and tenderer. But then it will be best to take them away, and keep them in another warren, lest they should be too and 6 months old; and a Hereford ox, 4 years a revolving weed extirpator.

them in another warren, lest they should be too and 6 months old; and a Hereford ox, 4 years Messrs. Bailey shewed cast-iron rick-posts,

wooled and short wooled sheep, pigs, &c.]

EXTRA STOCK.

This part of the Exhibition was no less grati-From a long account in the London Farmer's fring than the preceding, and nothing can more Journal, we have extracted a few of the parti fully shew the interest taken in the welfare of the culars, which may prove interesting to our Club, than the circumstance of so much excellent dressed, before the spectators, as above, and a Stock, from distant parts, having been sent under

Mr. Charles Champion shewed a Durham steer, 3 years and 3 months old, bred and fed by aim on grass, cabbages, turnips, and oil cakes.

Mr. John Drayson, a Scotch ox, 44 years old, fed by him on grass and hay. Travelled 81 miles. Mr. Robert C. Harvey, an ox, 2 years and 11 months old, bred and ted by himself on grass, hay, turnips, and oil-cakes. Travelled 105 miles.

Mr. Richard Kitelee, a Hereford ox, under 5 years old, bred by Mr. Tomkins, and fed by Mr. Kitelee, on grass, hay, turnips, and 1,500 lbs. of oil-cakes. Travelled 55 miles to the show .-The Judges commended this ox.

Sir Charles Knightley, Bart. a Monmouthshire ox, 4 years old, bred and fed by Sir Charles, on

Mr. Richard Rowland, a Hereford ox, 5 years

Mr. Charles Tibbics, a Durham ox, 3 years and 84 months old, bred by himself, (by Baronet),

Ditto, a Durham ox, 2 years and 111 months

Ditto, a Durham ox, 2 years and 81 months old, ditto, ditto.

Ditto, a Durham steer, 2 years and 9 months old, bred by him (by Rob Roy), and fed, &c. as above.

Ditto, a Durham Steer, 2 years and 11 months old, bred by him (by Justice), and fed, &c. as above.

Ditto, a Durham steer, under 3 years old, ditto. ditto.

(The Judges much commended the last six oxen.)

cakes. Travelled 78 miles.
Mr. Thomas Walker, a Hereford ox, 7 years old, bred by Mr. William Rayer, and ted by Mr.

Walker, on grass only. Travelled 85 miles On Monday, the weather continuing remarkand were evidently highly gratified with what they saw. From ten to three o'clock the Yard was so crowded, that to move otherwise than with ranks poured into the place, as fast as they could gain admittance.

Having already given an account of the stock, our next business is to furnish a brief statement

Of these we omit many as not so interesting

Messrs. Lees, Cottam, and Hallam, shewed an and 600 lbs. of oil-cake, the second prize of Ten corn bruisers; cattle hurdles, of iron, requiring Guineas.

fed on grass and hay only.

Next to Mr. Giblett's exhibition is Mr. Lee's of Leadenhall Market, where we saw hanging been intended for some such a customer, where their carcases might be seen together. There was also in Mr. Lee's shop some extraordinary

pressed his hope that the praiseworthy example of the Noble Marquis would be followed by the Noblity of England. There was no more useful occupation in which a Gentle nan could engage, han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to han that which it was the object of this Club to handle the prizes as breeder and feeder, were universally admired; as was his three-year-old Southdown Wether, which was judged to handle the prizes as breeder and feeder, were universally admired; as was his three-year-old Southdown Wether, which weight 160 pounds.* The following are the weight of Mr. H. Boys' Shearling Wethers, were universally admired; as was his three-year-old Southdown Wether, which was judged to weigh 160 pounds.* The following are the weights of Mr. H. Boys' Shearling Wethers, exhibited in competition with Mr. Grantham's.

No. 1, dead weight 119 pounds, fat 17 pounds -No. 2, do 111 pounds, fat 17 pounds-No. 3, do 110 pounds, fat 18 pounds.

These sheep were wholly of Mr. Ellman's breed, and were considered the heaviest Year-We have been favoured with the following ling South-down Sheep ever before exhibited in

Ir. Richard Kitelee's health was next drank, on street, seems to be by far the largest: his shop when we saw it on Friday contained forty-five the weight of the wether which has been killed, Mr. William Draycott was then presented pair of hind quarters of prime beef—also the was 165 hounds.

Messrs. Hailes and Brooks, of Newgate market, exhibited in the Yard, the carcass of a Cots-wold and Leicester Wether, belonging to Mr. Large, of Broadwell, Oxfordshire. It attracted DEAR SIR, general notice. There were two sent up to the above salesmen by Mr. Large, and their dead the Pennsylvania Agricultural Society, your opi-weights were 243 pounds and 204 pounds. They nions, in relation to the various breeds of neat were complete pictures, and as round as a barrel: cattle, in Lancaster county, and the result of your their proof was excellent. Mr. Large is famous experience with the Short Horn Stock you purfor these sheep, and in this way now and then chased at my farm in the last year. Will you be excites the wonder of the Londoners.

A pig of the Berkshire and Oxfordshire breed, 15 months old, bred by Mr. R. Smallbones, of ers? whether the milk is rich? whether the ani-Hordley, Oxfordshire, was much admired. weighed 322 pounds.

It would give us pleasure in this manner to go through the whole shew, were we furnished with the necessary particulars; for the chief recompense to the unsuccessful candidates for the trouble and expense they have incurred, must be ferent breeds taken to your county, approve the in receiving the just meed of praise which is due to their stock. We may add a statement of one or two facts connected with this subject, though not with the Shew, which have come to us, thoroughly authenticated. A lamb, 7 months HENRY A. CARPENTER, Esq. ? old, has been killed at Birmingham, bred and fed by Mr. Herbert of Powick, near Worcester, which weighed as follows: the four quarters 104 1b. head and pluck 6 lb. skin 91 lb.; at an early age it lost its dam, and was suckled by a cow. The other fact is, that Mr. B. Hobbs, of Can nington, near Bridgewater, sold at Salisbury fat his own breeding, for the sum of thirty-six pounds cattle, of Lancaster county. Males of various twelve shillings. Our correspondent says, this is breeds of neat cattle, have been brought to this o crack, though it may surprise the crackreeders of some of the midland counties.

To the preceding we add the following account of some superior cattle, lately slaughtered in the BALTIMORE MARKET.

A bullock 5 years 11 months—fatted by John Bar-ney of Delaware,

Two fore quarters	913 15
Hind ditto,	694

1607 lbs.

Two bullocks weighing 1322 and 1199 lbs. fatted

A heifer bred by Genl. Ridgely, of Hampton, and fatted by John Barney, of Delaware.

Two fore quarters,	438	lbs
Hind ditto,	379	70

A pair of working cattle bred and fatted by John Yellott, Senr. Esq. 1099 and 991 lbs.

The two steers raised and fattened by John Yel lott, Jr. of Baltimore County, and which were sold by Caleb Turner & Son, were of the following ages and weights:-

One six years old-wt. of Beef	1304	lbs
Rough tallow,	252	
Hide	146	
One five years old-wt. of Beef	1296	
Rough tallow	203	
Hide	130	
been all of the and a grade and more	3331	11.

Mr. Barney is now fattening a heifer, bred by Gen. Ridgely; which for early maturity and good handling, he thinks superior to any thing he John HARE Powel, Esq. Cor. Sec. of the Penn. Agri. Society.

FOR THE AMERICAN FARMER.

Powelton, June 5, 1823.

I am anxious to obtain for the information of pleased to state whether the cows are good milkers? whether the bulls are docile and good feedmals are hardy? whether you regret having paid four hundred and fifty dollars, for an imported 2. cow and calf, and proportionate prices, for half blood heifers by the admirable bull Denton? whether the practical farmers of your neighbour-hood, who have seen "Alderneys," and the dif-3.—1804. ch. m. Lady G. (Magician's Sam) bred selection you have made?

1 am truly, yours, &c.
JOHN HARE POWEL,

Paradise, Lancaster county.

Carpenter Hall, Lancaster Co. Pa. } June 14, 1823. }

DEAR SIR,

You desire to know, the result of my experiments, with the Short Horn Stock, I purchased market, on Tuesday last, six 4-tooth Wethers, of from you, last year, and my opinion of the neat county, some years back; but they have been so much crossed, with the common stock, and so sor, by the Godolphin Arabian. little attention has been paid to purity of blood, 6,—1808. b. m. Miss Tudor, by Hyperion; Lothat at this time there are none that shew any marks of a distinct breed. The two half blood heifers, by the short horn bull Denton, which you stated had calved last July, produced through the course of last winter butter of a better quality, than any I ever saw made in the month of May, and it was always obtained in about ten minutes churning. One of these heifers produced, a calf the beginning of June, the other (the three year old) has supplied nine labouring men all spring, with a sufficiency of milk (and butter once a day)

Telegraphe, by old Wildair; Logania, by Medley. See No. 6. wo buffocks weighing 1322 and 1199 lbs. fatted by Mr. Blandy, of Delaware; these were a pair of New York working oxen, which had taken the prize at a Cattle Show in that state

with a suniciency of milk (and butter once a day) which production exceeded that of a fresh milch grow of the common stock, which I had selected with great care, and that proved to be as good a heifer bred by Genl Ridgel. The suniciency of milk (and butter once a day) which production exceeded that of a fresh milch grow of the common stock, which I had selected with great care, and that proved to be as good a heifer bred by Genl Ridgel. The suniciency of milk (and butter once a day) which production exceeded that of a fresh milch grow of the common stock, which I had selected with great care, and that proved to be as good a heifer production exceeded that of a fresh milch grow of the common stock, which I had selected with great care, and that proved to be as good a heifer graphe, by old Wildair; Logania, by Medley. See No. 6. sorry that I cannot give you an account of the production of butter from the imported cow Moss Rose, in a given time, as her calf had got so old, before the trial was made, that it would not take to other cows; but I do not hesitate, to 10 .- 1814. b. m. Y. Minikin, by Gracchus, out of give it as my opinion, that twelve or fifteen pounds of butter, of the finest quality, can be made from 11 .- 1814. ch. m. Grand Duchess, by Gracchus, her, in one week, as she possesses, the power of secreting rich milk, in a greater degree, than any animal I have ever seen. I expect that this, is enough to satisfy you that as milkers, the Durham short horns, are not to be surpassed. The bulls are docile, and good feeders.

These cattle, are hardy, and their value, can only be estimated, by him, who considers the time, it requires, to alter the form, and propensities of the animal, and the degree of perfection 16 .- 1816. ch. m. Witch, sister to Wildfire, No. 14. it may be brought to. I therefore think it a want of thorough knowledge of the animal, that makes any person object to the price of the Durham short horns. All my neighbours express their astonishment at viewing my cattle, and highly approve of the selection.

I am, sir, your most obt. H. A. CARPENTER.

TO THE EDITOR OF THE AMERICAN FARMER.

DEAR SIR,

I do not think A Subscriber, has fairly, quotee the letter, to which he refers, in the last number of the Farmer. Whatever may be his surmises, his suspicions, or surprise, he will find, there is bon's dam. See stud book.

b. f. by do. dam by imported Chance; has "valuable properties as a milker, quick feeder, and small consumer." A writer styled Curwen, has explained the difficulty, which ap pears to startle him, to whom I would recal, an old adage "trust not to appearances,"-to a jaundiced eye, nothing can be fair. Deep milkers, it is acknowledged are generally great consumers. The term, deep, was not used, for it applies technically, to extraordinary quantities of milk. Quick feeding, conveys disposition, to become fat when dry, not to eating rapidly, or digesting hastily, as the gentleman who requires information, may comprehend. It is probable, Mr. M. never tasted, the Alderney cream, for although Alderney cattle, have been offered in the cow market, and have been distributed, for the last twenty years, in different parts of his state, it is rarely to be seen. If A Subscriber, refers to the remarkable cream, "that when kept separate it came in five minutes" and that when "mixed with the cream of other cows" the Alderney butter "came first was taken out of the churn, the operation continued half an hour before a second gathering took place." I will answer that the cream of short horn cows cannot equal this.

VERITAS.

Lancaster county, Pennsylvania.

Strickland's survey of the East Riding of Yorkshire says, speaking of 'Short Horns' 'many in-- f. by Gracehus, out of dam of No. 23. deed may be found which give eight gallons 'per day, and there are instances of a still greater quantity. The milk is also rich in quality, as there are instances of sixteen pounds of 'butter, eighteen ounces to the pound, equal to eighteen pounds of sixteen ounces being produced weekly from one cow, for several weeks after calving. Many bulls have latterly been purchased and hired into the East Riding at high prices from the neighbourhood of Darlington in the county of Durham, where a much superior breed of short horns are found, possessing all the perfections and qualities which are wanting in the Holderness breed.'

Bailey's survey of Durham, confirms this opinion so far by saying, that 'the Teeswater breed descended to the present time, in which were united the properties of feeding to great weight,

and being great milkers.'

FROM THE NEW ENGLAND FARMER.

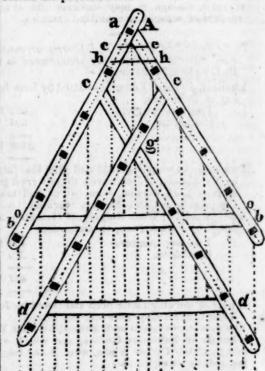

MR. ABBOT'S HARROW.

The drawing and description of the newly inented harrow, which we have published, this 56. 1814. ch. c. Rob Roy, by Gracchus, out of day, will, we believe, be found an acquisition to Lady Bunbury. (See No. 2.) never the agriculturist. We have carefully perused the descriptions, and drawings of English imple ments of the sort, as well as compared Mr. Abbot's with those now in use in American husbandry; and so far as we are able to judge, Mr. Abbot's is decidedly superior to any of them; it cheapness and the simplicity of its construction are not among the least of its merits, it is so oroad, and as it were tortified by the position of its timbers, that it cannot fail to be very stron and durable. It will be observed that the teet are so placed that not any two of them move in an improvement on one which I invented in 1818;

one tract, and that the tracts are at equal distan es from each other, which are desirable things in the construction of harrows. Sir John Sinclair says that "teeth of harrows should either be ound, or perhaps with a sharp edge, bent forward, like so many coulters, as they make them, any other shape, and work easier after the horses." We should believe however elves cleaner than when they are square, or of were square, and set diagonally, so that one corner of each might go forward in the line of motion, that the harrow would be as easily drawn, and perform as good work, in ordinary cases, as in any shape which could be given them. If the ground be rough, the teeth of the harrow should be set standing a little backwards, so that they may not be so liable to catch or hang by roots, stones, &c. But when the ground is smooth, the teeth should slant a little forwards. The best way to fasten harrow teeth according to Dr. Deane, is with shoulders under the harrow, and nuts screwed on above. A friend, however, has suggested that a better and cheaper way is to place strong slips of timber over the beams of the harrow so as to press on the heads of the teeth and confine those slips in that position by spikes, or iron pins, with screws.

Harrows of the construction abovementioned, are for sale at the Agricultural Establishment, No. 20, Merchant's Row, Boston.

Greenland, N. H. March 12, 1824. SIR,-It has not been in my power to send you the following plan and description of my Harrow before the present time.

This Harrow combines the following good properties. It is strong. It is less liable to be choked with sods or stones, than any other harrow, which cuts the ground as finely and is in use in this country, or is described in any agricultual books, which have come to my knowledge. It s easily cleared, when choked. It is so well baanced, that it needs no additional weight to keep my part of it to the work; and it cuts all the round over which it passes, at equal distances, cuts deeper into the ground than harrows, whose teeth are placed nearer each other. It is

form, it is important, that this should be carefully preserved. Some persons have adopted a mutilated form of it; and by shortening the in-ner beams, and inserting more teeth in the outer ones, have destroyed the proper balance of their harrows; and rendered them much more liable to be choked, than those are, which are made agreeably to the plan.

the beams of a common field harrow to be drawn by two horses. A harrow made on this plan, having its teeth sufficiently near, and having suitable handles answers an excellent purpose for harrowing between the rows of corn, potatoes, and other vegetables.

To form this harrow, let the outer beams be butso, that the teeth at b and b may be at the same getables. The spaces between the traces, cut in the ground by the teeth, will be only one quarter made so, as to be fastened by a screw and nut at top, so that they may be taken out, if necessary, to accommodate the harrow to narrower spaces in the latter stages of cultivation .- The inner beams should each be parallel to one of the outer ones, and tenoned into the other at c, so, that the line, in which the teeth are inserted into them, may intersect the line of the teeth in the outer beams exactly in the midst, between the 2d, and 3d. teeth from the foremost one. Let the inner beams be halved together at g, where they intersect each other. From the point c, where the line, in which the teeth are inserted in the inner beams, intersects the line of the teeth in the outer ones, set off on one of the inner beams, at the distance of the teeth in the outer beams, as many places for teeth, as there are teeth in either of the outer ones; and on the other one mark the same spaces; but do not insert teeth in the two forward places. Let a bar oo, of suitable width and an inch or more in thickness, be passed through all the beams immediately be fore the hindmost teeth in the outer beams, and behind the third place of the teeth in the inner beams. If it be of suitable width and properly inserted, it will not interfere with the places designed for the teeth. Let a similar bar be passed through the inner beams, between the two hindmost teeth, at d d. Fasten the two outer beams, where they are butted together by a trennel at e, and at a little distance behind the trennel insert an iron bolt at h to receive the tured more than 3,000,000 pounds-many famihook of the chain, by which the harrow is to be lies make from 3 to 400 pounds, and were the drawn. Let the tenons and the bars be suitably whole Union to produce it at the same rate, we pinned; and let the teeth be inserted in the places designed for them. For scarrifying ground double the quantity necessary for the consump-not ploughed, teeth made flat and sharp like the tion of the United States —The time devoted to

Your obedient servant,

EPHRAIM ABBOT.

DO = EXTRACT TO THE EDITOR,

Dated Washington, March 6, 1824. DEAR SIR.

fifteen or twenty pounds of it, but it was all snatched up whilst I was engaged with the business of our society. I have bespoke some of seen and much admired it. this spring's making, which I shall send you. We are all alive here about the fate of the ted together at A, so as to form with each other an angle of an equilateral triangle; or in other words the slightest doubt amongst us, either as to the expediency or constitutionality of an increase of distance from each other, that they are from the duties. It is somewhat singular to remark the is the great destruction made among the sugar tooth at a. The distances between the teeth in different aspects in which the same object will trees, by cutting them with an axe, instead of the several beams must be equal; but may be greater or less at pleasure. The distance between the teeth in a field harrow may be a foot. a much worse situation than we are No arti-look forward and see what the consequences will But six or seven inches, is sufficient for the dis- cle from our farms will bear transportation to be in a few years. tance between the teeth in a harrow designed to market, with the exception of horses; and I An improvement has lately been made in the be used between the rows of corn and other vefear they will not pay well.—We have had quite manner of tapping the sugar tree, which, I hope, a mild winter—the medium heat for Jan, was 39 to will be widely circulated, that it may supercede as great, as the distance between the teeth in the beams. The hindmost teeth in the harrow, that are used between the rows of corn should be the Parman. The cational be the Parman that the parman t the Farmer. The subject has a close connexion exclusively in the state of Kentucky .- It is this: with husbandry, and might be highly serviceable to foreigners who contemplate settling in our dig a hole large enough to set the vessel in, which country. A table might be so arranged, as to is designed to catch the sap: saw off the end of rature in five or six places in the United States, that the sap will run more freely this way, than and not occupy more than two pages of your pa-by any other way yet discovered. per. Should you think proper to publish such a table, I should with much pleasure furnish you of tapping trees, is this: the sap can be shelterwith the necessary notes; as one of my sons ed from animals, and from leaves and dirt, by makes regular notes three times a day-also of placing a board over the hole. I hope farmers the wet days, and some other observations. ALEXANDER REED.

From late numbers of the London Farmers' Journal, received at the office of the American Far-

Nose Making .- The following account of Ta-The people of the United States within the liacotius may be amusing after the description given in our last of an operation performed by Mr. Travers, of St. Thomas' Hospital.

Gasper Taliacotius, was born at Bononia, 1553, and was Professor of Physic and Surgery there; he died 1599; his statue stands in the Anatomy Theatre there, holding a nose in his hand. He wrote a treatise in Latin, called Chirurgia Nota, in which he teaches the art of engrafting noses, ears, lips, &c. Many are of opinion that he never put his ingenious contrivance into practice, as being too painful. He is not singular in his doctrine, for he shews that Alexander Benedictus, a famous writer or surgery, described the operation for lost noses before him; as does that great anatomist Vesalius; and Ambr. Pareus mentions a surgeon that practised this art with success in several instances. Our own countryman, Mr. Charles Barnard (Sergeant Surgeon to monly used.—It must be obvious to every one, March.—A single tree is said to have yielded 5 Queen Anne,) asserts that it has been provided with wonderful dexterity and success, as may be row is constructed, that it may be made larger or by stand on an acre of land, and it has been cal-

that it is a most surprising thing that few or none should have since attempted to imitate so worthy and excellent a pattern. Dr. Fludd, a Rosecrucian Philosopher and Physician, informs us of a Nobleman in Italy, who lost part of his nose in a duel; he was advised by one of his physicians to take one of his slaves, and to make a wound in his arm, and to join the little remainder of his nose to the wounded arm of the slave, and to continue it there for some time, till the flesh of the arm was united to his nose. The nobleman prevailed on one of his slaves, on the promise of his freedom and a reward, to consent to the experiment, by which the double flesh was united, and a piece of flesh was cut out of the slave's arm, which was so managed by a skilful surgeon as to serve for a natural nose. The slave being re-warded and set free, went to Naples, where he fell sick and died; at the same instant a gangrene appeared on the nobleman's nose; upon which that part of the nose which belonged to the dead man's arm was, on the advice of his physician, cut off, and, being encouraged by the above mentioned experiment, he was prevailed upon to have his own arm wounded in like manner, and to apply it to the remainder of his nose, which he did; a new nose was cut out of it, which continued with him till his death.—[See Notes to Hudibras; and Sir Kenelm Digby's Discourse concerning the Power of Sympathy, 1660, page 115.]

The following, from an Evening Paper, is an extract of a letter from Mr. R. Gourlay to Mr. Cobbett:-

The acacia, like the ash, tender in its bud, unfolds slowly and late. It is not in full leaf till June, and throughout June, while young, continues to push out plume over plume. It is then the very queen of slender trees; but let us not say

You are making a job of public credulity You have astounded Johnny Bull, and would even persuade that he might feed on locusts like John the Baptist. Good-natured John will re collect that the other had honey with his locusts. Your locusts have prickles when they are young; and when old will certainly fall short of expec tation. When old and unpruned they get naked, ragged and wretched looking; while for posts, I

about pigs and Swedish turnips; when you boasted that you had done the western world infinite service, by routing out the "long-eared, long-"nosed, long-legged, long-backed, pot-bellied "pigs," with your superior breed, though, in fact, the Americans had thousands of pigs as good as yours. It is also true, that though you succeeded one year with Swedish turnips, you failed at last from the dry and parching nature of the climate, which is ill adapted for turnips of any sort. In America every body came to see that both your pigs and turnips were got up only for sale, like Peter Pindar's razors; and so it will be, ere long, in England, with your Amerian

Climate and soil every where affect trees and fruit-make some of the same species superior in America, and now in England. Change, it self, will often, for a time, produce most striking

At Montreal there are famous sorts, which were brought from France; and these bear still more luscious fruit on the banks of Detroit river, 600 miles farther to the south-west, where the French had an early settlement. In Britain the larch is excellent wood; in Canada, where it is indigenous, it is a puny tree, and good for little. In America, the acacia may yield timber hard and tough; in England soft and brittle. The fact that it grows rapidly, and flowers when young in England, is a symptom that it will not prove durable when put to use. The Scotch fir, which you call villanous-no doubt because you hate every thing Scotch-is, upon the whole, the most universally useful tree, whether as a nurse for others, or of itself. It is the pine hewn on the Norwegian hills for masts to the tall admiral; and it is the yellow pitch pine of Canada, one of which is worth a dozen of the prevailing white pine for endurance or fuel.

They only who have read your writings, on both sides of the Atlantic, can fully appreciate your merits as a quack. As I know them well, I am disposed, on this occasion, to expose them solely for public good, assuring you that I am extremely sorry for it. Were you but to use honesty invariably as the best policy, few men could so much benefit society.

ROBERT GOURLAY.

DEATH OF LORD ERSKINE.—The melancholy intelligence of the death of this distinguished lawyer and patriot reached town on Friday morning. He died on Monday evening at Almondale, six or seven miles from Edinburgh, of an inflammation in the chest. The news of the event is more afflicting to his friends, because the general health of Lord Erskine was such, that, but for this acute disease, to which the young are equally subject with the old, he must have in all probability, reached an extreme old age. Lord Erskine was remarkable for a vigour uncommon at his time of life, and for an elasticity of spirits, which made him the delight of all with whom he came in contact. Lord Erskine had been twice before ill of the complaint which has now proved fatal to him—in 1807 and 1819. His recovery at the last of these periods was deemed impossible, would prefer the yew. I have travelled through but his extraordinary stamina bore him out against Canada, and thence, repeatedly, by various routs the expectation of his physicians. Almondale was to New York, but never saw the locust indigenous, though it is often planted there in gardens, of the late Hon. Henry Erskine, the brother of

Editorial Correspondence.

" In truth the farmers of the exclusively grain growing states, are suffering under their accu mulated crops of grain, and view the tariff bill "as the means of promoting home consumption "in this country, as the same system has done in "every other country. I was delighted to see "your extracts from an unpublished pamphlet "on the subject of Tobacco.—The argument is "conclusive, and applies with equal force to the "articles of cotton and grain."

Extract, dated Pittsburg, 31st March, 1824 You may rest assured, that whatever southern planters may apprehend from the new tariff, Pennsylvania farmers, and those of the western consequences. Many of the best American Apple states, look to it as the only certain means of separate was totally consumed by the bug, while the other ple trees were carried from Europe originally. curing their prosperity, and that of the Union. part among the corn remained untouched! The

REPORT FOR THE MONTH OF MARCH. Of agricultural appearances and prospects in Shenandoah valley.

It would be of much service to our readers if all our correspondents would follow the good example of Mr. Turner, in taking occasion, when writing to us on other business, to give a general view of the effects of the season, and the prospects of various crops in their section of country, at the time of writing; we shall en-deavour to digest a plan that will secure us regular reports of this sort, unless we are deceived in the co-operation of certain publick spirited citizens, on whom we can rely for this good service to the common cause. Mr. Turner's letter was not written for publication, but we know he will not object, finding it as we do, containing interesting remarks, and offering as it does, an appropriate opport unity to throw out the hints which it has here suggested.] Ed. Am. Far.

AGRICULTURAL REPORT. March 29th, 1824.

DEAR SIR,

Having received the last number of the 5th vol. of the American Farmer, I herewith, with great pleasure send \$5 in advance, for the 6th vol, as the "best proof I can give of my approbation of your labours," and I sincerely hope the work will receive a continued and increasing patronage, commensurate with its intrinsic merit and usefulness. With respect to our agricultural prospects, they are now so fluctuating and transitory, and the result so liable to be influenced by innumerable casualties, that they ought never to be spoken of, but with extreme diffidence; the most flattering appearances are often blasted in a few hours, and hope extinguished becomes revived in a manner equally miraculous. I can therefore only venture to say that our crops of small grain, (in consequence of a dry, cold autumn, very unfavorable for vegetation,) appear much more unpro-mising than usual: the month of January was mild and favorable, but the last six or eight weeks have been the reverse: there has been less snow than perhaps was ever known, and the ultimate thawing and freezing by day and by night, has caused a good deal to be cast out of the earth. Nevertheless, our crops are at this time improving fast, they exhibit a pretty uniform appearance, though unusually backward in growth; and nous, though it is often planted there in gardens, and and round houses for ornament as in England, and for which it is here to be found in every nurseryman's possession. In the southern parts of Pennsylvania I have been told it grows indige
Pennsylvania I have been told it grows indige
Chancellorship in 1806, and retired from the appeared among us; its attack on our corn was formidable, and I believe would have been fatal if it had not been for the irresistible counteraction of frequent showers, affording the best season for that noble plant, ever experienced .- I gathered from 95 acres, 4715 bushels, and finished housing it the 15th of November, the best crop of corn I have ever made.-It was in some degree, though not materially, injured by the bug. I have a surplus of about 2500 bushels, which I can't sell at any price,—In relation to the chinch bug, a fact occurred, which I deem worthy of communicating-a lot of ground near my dwelling, containing about four acres, was planted, one half in seven or eight varieties of Indian corn, the remainder sowed in millet,-In September the millet being harvested, the whole was sown in rye, the rye growing in that portion of the ground which had produced the millet, 3d. To preserve both the strength and quality of ment of the efficacy of this new method with rethe flax.

4th. To effect a saving of the material in scutching and hackling, of more than 10 per cent.

5th. To preserve the waters and air from infection, and the fish from being destroyed.

That they commenced their observations by at one side, and letting it out at the other.

4thly. By renewing the water at stated inter-

He states that the improvement suggested was

He adds in a note, that "the gum in the head That Mr. Devos was a farmer remarkable for of the plant has nearly one half more consistence careful steeping.—That to make further experition at the root; and that the flax-dressers always find that the heads are never sufficiently steeped, and that they cannot clean them without much trouble and a great loss of flax."

The spontaneous descent of the steeped flax, he states, to be an indication of its being nearly sufficiently rotted; since at the moment when the particles of air which the plant contains, wrought in competition in the same loom; that have all escaped by the decomposition of the gum, the entire mass quits the transverse poles, fineness of which that species of flax was capa- and settles spontaneously at the bottom of the

> That at this moment it is necessary to be on the watch; to take out a handful of the flax, to dry it, and to examine the state of the gum; which trial should be repeated every six hours, for the wholly got rid of, and before the filaments of the

That when that exact point is attended to, the were tied together, and underwent the same it by its growth, or to deteriorate it by its humidity. That the spread flax should be turned in four or five days; and that finally, in lieu of a change of water, the extent of the steeping pool should be proportioned to double the mass to be steeped, by which the flax will acquire that shining and blueish whiteness which indicates a superior quality.

In another part of the Memoir, the author

" That those who steep their flax by heaping the bundles upon each other horizontally, draw even from that one mass, two or three different colours, which affect the filaments of the flax, and as many more perhaps before the termination of the steepage, owing to the unequal operation of the temperature of the atmosphere, which acts with infinitely more force near the surface, than in the depth of the stagnant water. That the result of this irregularity is, that whilst the bunthose at the bottom not enough. That as the steeping pools are generally as full as possible with flax, the colouring particles of the gum being diluted in but a little water, acquire thereby the power of rendering certain portions of the flax nearly black, blue, or red, according to their position in the mass.

than the latter; it is, also more permanent and The common wheat when not injured by fly or certain, and above the reach of restraining and

much of it, or I would have paid more attention to it than I did at first; and it only shared the same fate, as to cultivation that the rest of the throughout the state, will for a moment, take a bounds of our country, from the raw material corn lot did; but to my great astonishment it put breathing spell from the busy strife of politics, furnished by ourselves, the value of our lands out from 15 to 20, and some more stalks, some as and occasionally turn an eye to the best interests would be increased, and the profits of agricultularge as common Indian corn from each plant! of our country, viz: agriculture and domestic ral labour considerably augmented. Demand and they grew generally upwards of 12 feet high! manufactures. A general communication of the and consumption would be directly extended—a and some had 12 shoots on a stock, but no ears, above important information cannot fail to progreat extent of soil devoted to the growing of products that now afford no sufficient stimulus to cultivation. The soil and climate of the United States are capable of producing the various articles necessary for such manufacturing establishments as will most naturally flourish in this Mr. Skinner,
I enclose, and request you will publish, in the sumed provided manufacturing labour should be

As to the articles of foreign growth, to which an increase of duty should apply, in order to promote the prosperity of our agriculture, the committee need only remark, that, if the principles which they advance be sound, the duty should embrace every raw material found or procured with ease and cheapness, and in abundance in the United States. The committee have conket, by an increase of duty on foreign articles, would affect the demand of our agricultural prolucts abroad, leads to a new train of considerations. The first inquiry which naturally occurs on this point is, what are the inducements with foreign nations to purchase the productions of our soil? what their motives? what the moving causes of the market which they extend? Is their policy founded on favour, reciprocity, self-inteest, or necessity? On this subject there is lite ground for difference of opinion. Foreign

their measures towards us beyond the compass of teeth, next the tushes, are called pincers, and bare expediency. They will consume our raw materials when they cannot do better; when they can, they will not not consume them. When the consumption of our agricultural products comes in contact with any principle of political economy applicable to their own condition, a hostile tariff meets us at their shores. Hence, the fo-reign market, for the fruits of our soil, depends but little on the sale which foreign manufac-tures find in this country; and whether we purchase more or less, foreign nations will graduate their policy towards us, by a standard inde pendent of any general system of duties which we may adopt; at least, so it appears to your committee.

How long would Great Britain purchase our cotton, if her own colonies could supply her demands? How many nations would consume any article that is cultivated by the American agriculturist if they could find their demand supplied on better and more advantageous conditions, by home industry? These questions are answered by their proposition; it is, therefore, the opinion of the committee, that the foreign market for our agricultural products, and for the staple articles of our exports, in the shape of raw materials, will not be essentially affected by any in crease of duty on those foreign manufactures which are composed of similar materials.

As to the amount of duty which should be imposed, it must always depend upon a variety of considerations, which need not be detailed : it should be sufficient to secure the exclusive and constant demand of our raw materials, and to sustain the American manufacturer in his pursuits; it must be competent to build up and protect those manufacturing establishments, at fire-sent in the country, and which, with a reasonable encouragement, will present a constant demand for those raw materials.

manufacture, which should be taxed in order to increase our agricultural prosperity, your committee would refer, generally, to the tariff now before the house. The committee do not perceive the necessity of selecting any articles, or of imposing any duties, beyond those embraced by that bill.

LAWRENCE, ON THE AGE OF THE HORSE. HOW TO KNOW IT.

is only determinable with precision by his teeth; maining colt's teeth, in order to make the horse and that rule fails after a certain period, and is appear five; but you will be convinced of the sometimes equivocal and even uncertain within fraud, by the non-appearance of the tushes: and that period. A horse has forty teeth; viz. twenty- if it be a mare, by the shortness and smallness of four double teeth or grinders, four tushes, or the corner teeth, and indeed of the teeth in single teeth, and twelve front teeth, or gatherers. general. To give an old horse the mark, is Mares have no tushes in general. The mark, termed, to bishop him; of the derivation of this which discovers the age, is to be found in the term I have no knowledge. They burn a hole in front teeth, next the tushes. In a few weeks, each of the corner teeth, and make the shell fine with some, the foal's twelve fore teeth begin to and thin, with some iron instrument, scraping all shoot; these are short, round, white, and easily the teeth to make them white; sometimes they distinguishable from the adult or horse's teeth, even file them all down short and even. To this with which they come afterwards to be mixed, they add another operation; they pierce the skin At some period between two and three years over the hollows of the eye, and blow it up with old, the colt changes his teeth; that is to say, he a quill: but such manœuvres can deceive only the sheds the four middle fore teeth, two above and inexperienced, and in case of dispute would be two below, which are sometime after replaced detected in an instant. Of the colours of horses, with horse's teeth. After three years old, two nothing, in my opinion, can be said more to the others are changed, one on each side the for-purpose than to repeat an adage of old Bracken,—mer; he has then eight colt's and four horse's "A good horse is never of a bad colour." Mo teeth. After four years old, he cuts four new dern light and experience have been happily teeth, one on each side those last replaced, and employed in detecting and exploding the theohas at that age, eight horse's and four foal's teeth. retic whimseys of antiquity upon almost all sub lation, either fair or foul, those articles of foreign These last new teeth are slow growers, compar-jects; among the rest, upon that of attributing manufacture which we are in the habit of put

vour, and even reciprocity, form no basis for ed with the preceding; they are the corner are those which bear the mark: this mark consists in the tooth being hollow, and in the cavity bearing a black spot, resembling the eye of a bean. The tushes may then be felt. At four years and a half old, these mark teeth are just visible above the gum, and the cavity is very conspicuous. At five years old, the horse hashed his remaining four colt's teeth, and his tushes appear. At six, his tushes are up, and appear white, small and sharp, near about which is ob-servable a small circle of young growing flesh; the horse's mouth is now complete, and the black mark has arrived at, or very near the upper extremity of the corner teeth. At seven, the two FRIEND SKINNER, middle teeth fill up. Between the seventh and eighth year, all the teeth are filled up, the black to furnish the tobacco planters with friends of the mark hath vanished, and the horse is then said to be aged, and his mouth full.

From that time forward, the age of the horse can only be guessed at from certain indications; but these guesses are usually made with considerable accuracy by experienced people. If his little left for them to do in the "demolishing teeth shut close, and meet even, are tolerably way." What can have brought upon us poor white, not over long, and his gums appear plump, devils, such killing kindness, God only knows; you may conclude he is not yet nine years old. At for it far transcends all human intelligence to that age and as he advances, his teeth become comprehend. The author must surely be another yellow and foul, and appear to lengthen, from the Philo Hamilton; or, as I rather suspect, the reshrinking and receding of the gums. The tush-doubtable champion himself; for this publication es are blunt at nine; but at ten years old, the cavity or channel on the inside in the upper tushes until that period to be felt by the finger, are entirely filled up. At eleven, the teeth will be very long, black, and foul, but will generally meet even; at twelve, his upper jaw teeth will overhang the nether: at thirteen and upwards, his tushes will be either worn to the stumps, or long, black, and foul, like those of an old boar. Beside those exhibited by the mouth, nature ever furnishes variety of signals, denoting the approach of old age and decay, throughout the bo-In fact, as to the articles of foreign growth and dies of all animals. After a horse has past his prime, a hollowness of his temples will be per-ceived; his muscles will be continually losing something of their plumpness; and his hair, that gloss and burnish, which is the characteristic of youth and prime, will look dead, faded, or en tirely lose its colour in various parts. In proportion to the excess of these appearances, will be the horse's age.

The following are among the devices practised by a set of unfeeling rascals, who have no other rule of conduct than their supposed interest, to mode of coaxing, I cannot but say, that the vercounterfeit the marks of age in horses. At four worst of Dr Kitchiner's "peristaltic persuaders" The age of a horse, it is sufficiently well known, years old they will frequently knock out the re-

this or that, good or evil quality, or temperament, o the colour of a horse. All that I am warranted in saying, from my own observation, is, that I have seen more bad horses, of all kinds among the light bays, with light-coloured legs, and muzzle, than amongst any other colours; and the most good saddle and coach horses, among the common bays, with black legs and manes, and the chocolate browns. This, in all probability, has been accidental.

If the other numbers of your 6th volume, are same stamp, with the one who has graced your 1st number with a few of his lucubrations from " an unpublished pamphlet," &c. the enemies of these ill fated agriculturists, would do well to expedite their attacks; or there will be precious has the invariable accompaniment of every thing from his pen, that I ever saw: to wit, scraps of letters without number, and interminable ari hmetical calculations, which make the natter in hand, (to borrow a southern phrase of much sterling value,) "all as clear as mud." But let this pass, that I may beg of you, for pity sake, to tell us how you have stumbled upon such a correspondent; or rather, how he could continue to stumble upon you? could it be necessary, my good sir, to accumulate such a mass of figures, and quotations, either from real letters, or such as have been fabricated in news papers for purposes of speculation, in order to prove the simple fact, which (by the way, I believe) no human being denies, that the price of our tobacco has fallen? Or was this the best method your correspondent could think of, to persuade us, that the most effectual way to benefit ourselves, was to agree, notwithstanding this diminished, and still diminishing revenue, to give him and his friends more for every thing they either have, or may have to sell? Truly if such is his logic, and such his are most admirable viands compared to them.

But he see as to think that by calling this ru inous project "the building up a home market, we shall all be cajoled out of our senses. Had this master mason served his apprenticeship at the erection of the Tower of Babel, some intelligible explanation might have been given of his present hallucinations. As this could not very well have happened, the man who would undertake to explain them, must have such a head, as it would be quite a hopeless task to find; for they amount to this,-that the less we have to buy with; or in other words the more our products are reduced in price, the more we shall be able to purchase of every thing we want:—"the building up a home market," being the grand panaces or solving this unintelligible paradox. And the piece of architecture is, simply to exclude foreignanufactures, or to tax them so highly, as great y to diminish their importation.

Pray take the trouble to examine for a momen how this would work. If by any process of legis

LANCELOT WARFIELD, Inspector.

FOR THE AMERICAN FARMER.

REMARKS ON KEEPING COWS. APPLICABLE TO TOWN AND COUNTRY.

Many families in town are induced to forego the abundance of milk, especially where there are that the expense of keep is greater than the income. The liability to have our cows stolen by the commons, and sell them in the country for dry cows-or to exchange them for fresh ones, is a be more useful, than some others; at least its benefits would be felt and seen nearer home.

Then as to the firefit and loss-a cow need have no better food than the following:-hay I understand is now selling at \$10 per ton, but say \$1.40 per hundred, that would be for

Fourteen pounds per day-an ample

supply, 3 galls, of ship stuff, or 6 galls. Vir-10 cents.

ginia bran,

Yield of milk at least 10 quarts per

day the year round, at 5 cts. per quart, 50 cents. Consume in the family one gallon per day of good rich milk, giving abundance of cream for in the coolest part of the ship, or in a cool place tea and coffee, and still you would have six quarts per day for sale, giving 30 cents per day, or S9 to the West Indies, and back again to Denmark; per month, this would pay the whole wages of and although it had been eighteen months in the the best man servant, to take care of the cow and bottles, it was as sweet as first milked from the do all the work of the house besides, and give cow. yeast money in the bargain!! But if instead of long forage, cut hay, or cut straw, be used, a long forage, rut hay, or cut straw, or cut straw, woman may easily milk and feed the cow. The best way to give the bran or ship stuff, is to Sir,

The bay horse, Roanoke, got by Sir Archy out The bay horse, Roanoke, got by Sir Archy out two of Virginia bran; then pour on it a gallon of of the imported mare Lady Bunbury, will be perboiling water, and after stirring it well, add two mitted to cover the winner, or dam of the winner or three gallons of cold water and give it warm of any plate, match, or sweepstakes, of not less to the cow-some cows will not eat slop well in than £50 value, gratis. He is a fine blood bay, the beginning; in that case put a little water at with black mane and tail, and black legs; was first and increase it gradually. To this food may never backed, but is quite gentle; is nearly, or be added the slop of the kitchen—or that may be quite 16 hands high; a much handsomer horse given to a hog, and will give you 300 weight of than his sire; and many good judges think of good meat in a year. These are among the "small matters" which the master of a family is Middle Quarter in Charlotte county, Virginia, and plaster of salve too apt to think beneath his notice—but he should He never covered until 1822, and his foals of last next. oap of first quality.

A House Keeper and Subscriber.

Can this be true ?- Edit. Am. Far.

To make Transparent Soap. Suet is the basis of all the soaps of the toilette, known by the name of Windsor soap, because olive-oil forms a paste too difficult to melt soap, which, if well prepared, has the appearoap.

To cultivate . Isparagus, That part of the garden which is longest exlosed to the sun, and least shaded by shrubs and Vegetable Liquor to hasten the blowing of Bulbous rees, is to be chosen for the situation of the asaragus quarter. A pit is then to be dug 5 feet naking up the beds.

the following proportion and order:-

6 inches of common dung-hill manure.

8 inches of turf.

6 inches of dung as before.

6 inches of sifted earth.

8 inches of turf.

6 inches of very rotten dung.

8 inches of the best earth.

feet wide, by paths constructed of turf, 2 feet in breadth and 1 in thickness. The asparagus must

asunder. In planting them, the bud, or top of and a half in the ground, while the roots must be spread out as wide as possible, in the form of an umbrella. A small bit of stick must be placed For obstinate Ulcers in the legs, &c .- Direc- as a mark at each plant, as it is laid in the ground. tions were given in the last number of vol. 5, for As soon as the earth is settled and dry, a spademaking this poultice, which were founded on mis- ful of fine sand is to be thrown on each plant, in plantation, the young shoots should be cut off, and Boil the catnip for a while in vinegar, then the planting will, with these precautions, be take it out and put in new milk thickened with equally successful; though it should be performed at four they are apt to fail.

In three years the largest plants will be fit Economy and safety in making Soap .- I ob- to cut for use. If the buds be sufficiently served in your paper of last evening, an account large to furnish a supply in this manner, the asof a Mrs. Jacobus having four children scalded, paragus should be cut as fast as they appear; by a kettle of soap falling from the fire. To pre-otherwise they must be left till the quantity revent a recurrence of similar accidents, I am in-quired has put forth; in which case the variety duced to offer the following safe and economical in colour and size prevents them from having so agreeable an appearance. An iron knife is used

The asparagus-bed now described will generally last thirty years; but if they be planted sionally stirred, will, in a few days, produce a in such abundance as to require cutting only once in 27 years, half the bed being always in a state of reservation; it will last a century or more. The turf used in making the beds should be very free from stones.

Another Method.

Make the bed quite flat, five feet wide, of good soil, without any dung, long or short: sow it with onions. Then sow two asparagus seeds (lest again, and contains an odour too strong to be one should fail), about one inch deep, near each mixed with essences. The suet soap dissolved other: twelve inches each way sow two more; with one half of alcohol, and put it near the fire Brompton stocks. Six pounds are sufficient for the knowing ones came out at the little end of the until the soap is dissolved: this mixture placed any strong plant: setting them to flower near horn. into a mould to cool, produces the transparent double ones is of no use. The excess in petal arises from cultivation, and transplanting into rich soil; wild flowers are seldom double. Keep all small seeds in the pod until you sow them.

rooted Flowers.

Take nitre, three ounces, common salt, one depth, and the mould which is taken from it ounce, pot-ash, one ounce, sugar, half an ounce. nust be sifted, taking care to reject all stones, rain water, one pound. Dissolve the salts in seven as low in size as a filbert nut. The best gentle heat, in a glazed earthen pot, and when arts of the mould must then be laid aside for the solution is complete, add the sugar, and filter the whole. Put about eight drops of this liquor also be received.

The materials of the bed are then to be laid in into a glass jar, filled with rain or river water. The jar must be kept always full, and the water removed every ten or twelve days, adding each time a like quantity of the liquor: the flowers also must be placed on the corner of a chimneypiece, where a fire is regularly kept. The same mixture may be employed for watering flowers in pots, or filling the dishes in which they are placed, in order to keep the earth or the bulbs or The best layer of earth must then be well mix-plants which they contain, in a state of moisture.

D (40

On publishing the new Russian Tariff, the London Times makes the following, amongst other be planted about the end of March, 18 inches observations:-" The Ministers of the Emperor Alexander have, it seems, made a considerable addition to the import duties on foreign manufactures and produce. In other words, they have been throwing fresh difficulties in the way of Russian exports to foreign countries. To what extent the English trade may suffer from the adoption by Alexander of these fiscal barbarisms, already worn out and condemned by the discerning nation against whose interests he would now direct them, it is easy to guess. Russia cannot injure Great Britain by means which are calculated to repress the rising industry of Russia herself, but to rouse the enterprise of Englishmen into a search after new paths of commerce, and into a cultivation of resources before untried, only because the want of the.n had not been hitherto experienced. We have little to dread from a rival armed with those very weapons which we have ourselves cast aside as unserviceable. The war of prohibitions is disasterous to none so completely as to him who wages it; and the Russian government, by this gross blunder, proves against itself an absence of political civilization, no less remarkable than that moral and social rudeness which have long been a reproach to its subjects."

> CHESS .- The London Chess Club have receiv ed an invitation to play two games with the Paris Club. The challenge has been accepted, and on Tuesday last the players here were appointed. They consist of a committee, of which five are a quorum, who are to make the moves and transmit them. Amateurs, no doubt, will be gratified in witnessing this scientific contest, which will display the skill of, probably, the first players in Europe. The stakes are 50 guineas each game. We shall occasionally communicate the moves .-Dublin Paper.

TROTTING MATCH .- We understand that a trotting match took place a few days since on hot in alcohol retakes its solid state by cooling, and if the spring is cold and dry, let the weeds Long Island, between a celebrated horse called To this fact is due the discovery of transparent grow until rain comes. In October, cover the bed Poppet, belonging to a gentleman in Philadelphia, with manure, or rotten hot-bed. The next spring but formerly owned in this city, and a mare named ance of fine white candied sugar; it may also be coloured, and the vegetable hues for this purpose, the bed free from weeds. To raise seed, select the brickest stems: after blossoming sufficient, this soap, by putting in a thin glass phial, the half of a cake of Windsor soap-shavings; this it also the best way to raise double ten weeks and in 9 minutes, 46 seconds. We understand that with one half of alcabel, and put it near the fire

SIGNS OF RAIN.

In excuse for not accepting the Invitation of a Friend to make an Excursion with him.

BY THE LATE DR. JENNER.

- 1 THE hollow winds begin to blow,
- The clouds look black, the grass is low; The soot falls down, the spaniels sleep,
- 4 And spiders from their cobwebs peep.
- Last night the sun went pale to bed, The moon in halos hid her head;
- The boding shepherd heaves a sigh,
- For see no rainbow spans the sky.
- The walls are damp, the ditches smell, Clos'd is the pink-ey'd pimpernell.
- 11 Hark! how the chairs and tables crack;
- Old Betty's joints are on the rack;
- 13 Loud quack the ducks, the peacocks cry;
- 14 The distant hills are looking nigh,
- How restless are the snorting swine,
- The busy flies disturb the kine;
- Low o'er the grass the swallow wings;
- The cricket too, how sharp he sings;
- 19 Puss on the hearth, with velvet paws,
- Sits, wiping o'er her whisker'd jaws.
- 21 Through the clear stream the fishes rise, And nimbly catch th' incautious flies.
- The glow worms, numerous and bright,
- 24 Illum'd the dewy dell last night.
- At dusk the squalid toad was seen,
- 26 Hopping and crawling o'er the green, 27 The whirling wind the dust obeys,
- And in the rapid eddy plays
- 29 The frog has chang'd his yellow vest,
- And in a russet coat is drest.
- 31 Though June, the air is cold and still;
- The mellow blackbird's voice is shrill.
- My dog, so alter'd in his taste,
- 34 Quits mutton bones, on grass to feast; 35 And see, you rooks, how odd their flight, 36 They imitate the gliding kite,

- 37 And seem precipitate to fall—38 As if they felt the piercing ball, 39 "Twill surely rain, I see with sorrow
- 40 Our jaunt must be put off to-morrow.

to which a national table of the degrees of heat, suit of agricultural improvement ?- It may be oband fall of rain, in the various climates of the jected by some, that they do not feel themselves United States might be applied, we have shewn competent to be useful members, as not being in in the preceeding column the form usually given the habit of composition they are unable to comto such observations made at particular points.

observation here given might be omitted, though the more full the more satisfactory of course. For this annual summary of meteorological observations at Baltimore, for the year 1823, we are may decline to offer any thing in this way, may indebted to that very correct observer and useful make the most useful comments upon the comcitizen, Capt. LEWIS BRANTZ, by whom the pub lick has been provided through the Federal Gazette, for seven years past with monthly and annual tables, accompanied with instructive philosophical and sagacious remarks, and deductions. These tables have been embodied in separate form, and a few copies may perhaps be had at the Federal Gazette Office.

It remains now for us to find those who view the the AMERICAN FARMER, into all the states and territories.

-05 TION IN THE FARMER.

At a meeting of the Agricultural Society of the counties of Loudoun, Fauquier, Prince William, and Fairfax, held in Leesburg, on the President of the Society.

The duty which devolves upon me, on this oc-casion, would be highly pleasing, could I feel myself capable of discharging it in a manner worthy

you. approbation Agricultural improvement, is a cause calculated to interest the finer and the grosser feelings of our nature. The philanthropist contemplates with pleasure, the increased means of enjoyment, thereby afforded to the human family; the patriot sees therein, the growing power and prosperity of his country; the man of taste delights in the improving beauties of the rural scenery; the man of business sees in it the profitable results of a well applied industry; whilst the poor man's heart is gladdened with the abundance with which the "mouth of labour" may be filled. In such a cause who can be indifferent? None, certainly should be, for it embraces the interests, and the feelings of all. Our assemblage here therein, and a pledge of our persevering exertions to contribute something to the advancement of an object, which of late has engaged the attention in an unusual degree, of the best and wisest men of our extensive country.-Societies founded with the same views as ours, already ex ist in most parts of the United States, and are opportunity of witnessing their influence.—May will enable us to bring together a mass of infor-we not then with confidence invite the practical mation, tending to the happiest results. Much farmers of our country generally, to come for-of this kind of matter has been embodied by oth-

Recurring to the convenient and practical uses ward and associate themselves with us in the purmunicate in writing their views and practices to the To answer our general purposes, some heads of society.- The excuse is not sufficient-many that will urge it, are very capable of communicating the most useful information in a plain farmer-like style, well suited to the subject; and many who may decline to offer any thing in this way, may munications of others .- It has been well remarked by Judge Peters, one of the most zealous and enlightened friends to agriculture in our country, that " nothing injures agriculture more than whimsical novelties; except bigotted adherence to old and bad habits." Whilst then we invite the scientific cultivator to come forth and beat down those "old and bad habits," we look to the plain observing farmer as freely to assail all "whimsubject in the same light that we have done, and sical novelties" calculated to lead us to a misto whom we may look for the requisite assistance, application of our time and labour. Our part It will be admitted that the central position of of Virginia, particularly the county of Loudoun, Baltimore, makes it a proper place to concentrate stands high comparatively in agricultural reputhis information, and that under the combined tation; if such superiority exists, our society is forms and national application which may be calculated to give it a more extended usefulness. given to it, it will be appropriately diffused through by submitting its practices to more extensive obthe American Farmer, into all the states and servation. To the good farmer then I would say, come and give us the benefit of your superiority; to the bad, come and learn to do better; to all, COMMUNICATED BY THE SOCIETY FOR PUBLICA. come, for although some of you may not believe me, yet I must be permitted to say, we have all something to learn, and something to reform.

To no people in the Union is the subject more important or interesting, than to us. In some states, the growth of their manufacturing estab-8th of March, 1824, the following Address was lishments, absorbs in a great degree, their capidelivered by CUTHBERT POWELL, Esq., tal and their enterprise; in others, commerce is the leading interest; but in ours, agriculture is, and must be the predominant concern. Equally exempt from the long winters of the north and the scorching heat of the south, we are placed in that happy latitude, where grain and grass alike flourish, and where convertible husbandry may be most successfully prosecuted.—A system, which unlike the cultivation of cotton and to bacco, keeps up and improves the fertility of the soil, and beautifies the face of the country, whilst it diffuses plenty and cheerfulness around.

—A system which does not dissipate landed capital in the fleeting profits of a few year's crops, but carries with it the pleasing conviction of a still improving capital, whatever may be the yearly product; and the benevolent enjoyment derived from the reflection, that the portion of the earth committed to our care, will pass to posterity bettered by our labours. It is of this country, that the great, the judicious Washington remarks to-day gives an assurance of an earnest zeal in a letter to Arthur Young, "Was I to com-therein, and a pledge of our persevering exer-mence my career of life anew, I should not seek a residence north of Pennsylvania, or south of Virginia, nor should I go more than twenty-five miles from the margin of the Potowmac." Possessing then this happy region, thus distinguished by the emphatic preference of the father of his country, who knew it all; how ardently should usefully engaged in disseminating a knowledge of the most approved practices in husbandry, and its are wanting, in connexion with its natural adbest implements of labour, and exciting a lauda-ble rivalry in the improvement of the breed of ference thus expressed. If our society shall redomestic animals, and the fabrics of household ceive that support which the importance of its industry. That such establishments are well object so justly claims, an adequate fund will be calculated to have a happy effect upon our agri- collected for the distribution of premiums at an culture, must be admitted by all; that they have annual meeting, and an excitement be thus pro-already been productive of much good where duced which will effect much, whilst the study they exist, is attested by those who have had an and observations and experiments of the members ent parts of the Union, and much has been com-

A new era seems to have commenced in our manure, for the last twenty-five years, has confind convenient and practicable, the soiling system in summer, or the feeding in stalls or pens then may we say with the English farmer, the more stock the more fertility; without this change, stock the more impoverishment. This neglect of the means of imparting permanent fertility to our lands, is now the more obvious to us, when we discover that the mere application of plaster, without manure or vegetable matter returned to the is the opinion of many observing farmers amongst us, and in this opinion I have myself been in a and successfully used. To this magical powder, as it has been called, we owe much notwithstanding our errors, and probably continue to enjoy its benefits though in diminished measure, after the effects of a new application may have become imperceptible, because of the continued operation of ficient. The mystery which has hitherto enve- and its adhesive attraction for moisture is too in-

ers acting with like views as ourselves, in differ- loped the mode of operation with this powerful considerable. The small quantity in which it is mineral, although long the subject of inquiry with used, is likewise a circumstance hostile to this municated to the public through that valuable paper the "American Farmer," but there are peculiarities in every district of country, which require peculiar practices, or the judicious modification of those which prevail elsewhere.

mineral, although long the subject of inquiry with used, is likewise a circumstance hostile to this the chemist and the agriculturist still remains to idea. It has been said that gypsum assists the be elucidated. Chemistry, which has in its discoveries out stripped all other sciences in modern decomposition of manure. I have tried some extimes, may yet give us in this, and other matters periments on this subject," says this celebrated connected with agriculture, more perfect information." mation. The experiments of Sir Humphrey Davy, In addition to this respectable authority, many husbandry, which particularly calls for reflection and the suggestions which he makes from them, difficulties seem to stand in the way of both the and experiment. The successful application of although in opposition to the doctrines advanced theories which have been adverted to. If gypsum and the suggestions which he makes from them, difficulties seem to stand in the way of both the gypsum, or plaster of paris, to our lands as a by other chemists, are entitled to great respect. acts by the attraction of moisture, that effect we manure, for the last twenty-five years, has con- This gentleman, in his lectures delivered before should suppose would be increased by an increase tributed doubtless to the improvement of the soil, the Board of Agriculture in England, states the of quantity, and no continuance of its use could and the prosperity of the owners; but it may be result of his analysis of soils and vegetables, with diminish the benefits of its power, especially in well questioned, whether we have made the most a view to this subject amongst others; and from a dry season. But unfortunately this is not so. of the benefits which it offered. I mean in this, which he adopts the opinion that gypsum forms a Nor can we well conceive, according to this doctant whilst we drew from the land increased crops of grain and grass, through its influence, we erroniously concluded that nothing more was necessary to the continuance of those crops, than the analysis; clover and most of the artificial grasses acts at all. So too, with respect to the other sary to the continuance of those crops, than the continued application of it. The consequence of this error has been a most wasteful neglect of the manures produced upon our farms, and a still greater, of the means of making more, which a greater, of the means of making more, which a judicious husbandry would have carefully regarded. I consider this as the most prominent defect in our agricultural habits, in the county of Louden and the county of the cou doun more especially, and in which I hold myself equally culpable with my neighbours. The English maxim of the more cattle the more fertility, is true alone under a judicious management, but it is certainly untrue as we have gone on. Our stock of domestic animals has been enlarged acin that material of vegetable composition, and cultural improvements for the last twenty-five
cording to the increased growth of our pastures, their powers of production thereby circumscribed; years, and which, from the new aspects it has and to the utmost extent in which those pastures because in the workshop of Nature, like all other recently presented, invites pressingly to reflection and experiment. If the result of these summer, they have been permitted to trample the ficiency of any one necessary material, however should be a conviction, that our lands upon which others may superabound. If, then, the artificial plaster has been long and freely used, have allands to which they retreat for shelter; or at best use of plaster has removed the natural defect, and to scatter it upon the surface of the ground, where thereby brought into action the other productive we may then save ourselves for some time, the half its value is lost in the atmosphere before it materials of the soil, which could not be wrought expense and labour of a further application of it, is ploughed in. In fields thus trodden and grazed up without it, may it not be, that a course of luxu- whilst our eyes will at once be opened to the neto the quick, the plough can return little of vege- riant crops thus produced, has exhausted the extable matter to the soil to renovate its powers, cess of the other materials of vegetation, which the resources for manure, which our farms may whilst our barn yards afford not the means to sup-ply the deficiency. But if for this unprofitable course, we substitute to such extent as we may ginally defective. Should this suggestion be correct, it would seem to afford a solution of the tention in agricultural inquiry, lately, than the with green food cut and regularly supplied, and difficulty, attendant on the inquiry why plaster, proper rotation of crops, and there is none more in winter universally the feeding in pens with protection from the weather, and a free use of litter; rates with less power. The bountiful supply of field of investigation on which to enter, upon the a defective material, united to the accumulated present occasion, were I even able to offer you excess of others, which could not be used without any new views in relation to it. I shall only obat least so far as relates to winter feeding, we can lay no claim to the benefit of the maxim; nay, we ducts, beyond their natural average powers, and that certainty and abundance which attended must even admit the converse, and say, the more to which they have thus been again brought back. their first culture, it may well deserve experi-And hence we may account for the fact, remarked ment to ascertain how far the orchard grass, or by all our farmers, that the crops of clover, the vegetable which yields most gypsum on analysis, have always been most abundantly luxuriant, on that as the bountiful author of nature, has fitted soil, is insufficient for that purpose, and that plas-upon vegetation, on land where it has hitherto been long and freely used. That such is the fact, is the opinion of many observing formula. But whilst the effects of the various vegetable products, for the equality various living creatures which feed thereon, so has he furnished to mother earth, that variety of aliment which the system required. Let us pur-is the opinion of many observing formula. operate. In supplying what was wanting we may have been over-abundant in its use, and the soil wants.—To the success of the farmer, good tools wants.—To the success of the farmer, good tools great degree confirmed, by my experiments made in the last two years, and marked with precision, in the last two years, and marked with precision, upon various crops of grain and grass on my own upon various crops of grain difficulty of maintaining the most popular notions which have prevailed upon the subject. "It has til the axe, the hoe, and the plough were thus been supposed," says Sir H. Davy, "to act by its produced, how awkward and inefficient were the power of attracting moisture from the air; but labours, how helpless, how hapless was the conthis agency must be comparatively insignificant; dition of man :when combined with water it retains that fluid too that hitherto applied, in quantity more than suf- powerfully to yield it to the roots of the plants,

would be with you, gentlemen, an abuse of your attention. The public displays which our Cattle Shows will call forth, will do more to impress upon the spectators the importance of these advantages, than any exhortation which could be offered, whilst opportunities will be thereby af so too with respect to household fabrics, the emulation excited by public exhibitions, will do much for their improvement. And whilst we have little reason to expect, at the present time, the erection of large factories amongst us, and perhaps as little to desire it, yet it must ever be pleasing to see the substantial, and often beautiful products of female industry, wrought in the bosom of the family, held in proper estimation.— Happy emblems of domestic comfort, peace, and purity !- For excellence in these, we shall take a peculiar pleasure, I am sure, in the distribution of premiums; and the more, that they make no demands upon the public treasury for bounties to support them, they make no clamour at the doors of congress for alterations of the tariff, they seek not their prosperity by the oppression of other branches of industry.

But, gentlemen, there are other considerations which give interest to the cause in which we are engaged. To impart dignity to the profession of agriculture, to raise it to its proper rank in relamind of man requires occupation as well as his body, and wherever the business of the cultivator shall remain a dull routine of manual labours according to established habits, without reference to the principles upon which they are founded, or

which they have a strong ligamentous attachment.

ments, cartilages, membranes, &c. each of which great pastern and the sesamoid-bones. It articupossesses numerous blood vessels and nerves; lates with, and moves easily upon them. If we and is, therefore, susceptible of inflammation and view the fore-leg of a horse, (particularly when heels, and, taking a turn forwards, is blended pain. The horny part, on the contrary, is void the other is held up, that more weight may be with the coronary ligament. At its widest or of sensibility, and serves principally as a defence sustained by the leg we examine,) the straight or to the sensitive parts which it covers: it is enperpendicular direction or position of the limb between the sensitive frog and the flexor tendon,
dued, however, with considerable elasticity, which from above to the fetlock joint, and its obliquity the intermediate space being filled up with an enables it to yield, in some degree, to the impulse or slanting position thence to the foot, can scarceof the internal or sensitive foot in the various ly escape observation. From this examination it motions of the animal. From this view of the may be readily conceived, what astonishing spring it receives the pressure of the horse's weight, subject it will be obvious, that if by any means a disposition or tendency to contract or shrink be formed; and what strength must be possessed by induced in the horny covering or hoof, the interthe ligaments of the fetlock joint, to enable it to
nal sensitive foot will be more or less compressed: maintain its position, under the immense weight
sustaining pressure, it must have a similar influ-

8. The Elastic Membranes or Lamina cover all conceive, however, that if one old horse can be the extremity of which they turn off at an acute of the body, are subject to disease from various ing neither blood vessels nor nerves; they appear several colts with diseased frogs and contracted secreted or formed by the laminæ of the coffinin that description the pasterns, canon, and sesa-moid bones. bone, unless the foot is macerated in water, or whole. kept in a moist state for some time before it is

horn it acquires from the clastic laminæ.

2. The Nut-bone is in shape not much unlike a 10. The Extensor Tendon is fixed or inserted weaver's shuttle. It is interposed between the into the upper and front part of the coffin-bone; flexor tendon, and the other bones, to remove the and the flexor tendon into the under and posterior

11. The Sensitive Frog resembles a wedge, its

large slices of it with his butteris, and nailing to both on the coffin-bone and the nut-bone; to which to pressure. The sensitive frog is made up of cartilaginous and fatty matter, and possesses considerable elasticity: its fore part rests on that part of the flexor tendon which passes over the nut-5. The two Sesamoid-Bones are placed at the bone; and on that which is inserted into the coffinmost constantly exposed. The horse's foot may upper and posterior part of the great pastern; to bone; from this part its eleft or division commences: only a small portion, therefore, of the sen-6. The Canon or Shank Bone rests both on the sitive frog rests on the coffin-bone, and flexor tendon; the wide part of the frog projects considerably behind these, forming the bulbs of the posterior part, there is a considerable distance elastic fatty kind of matter: by this contrivance the frog is capable of considerable motion, when ence on the elastic parts with which it is connected; the lateral cartilages, and the lateral portions of the coronary ligaments. These, being covered by the flexible horny matter at the top of the hoof or coronet, must necessarily have the same effect upon it: thus it is that when the horse is in motion, there is a certain degree of motion in the heels served in a sound state perhaps as long as other are convex, resembling, indeed, the shape of the and quarters of the hoof at the higher parts, or where the horn is flexible.

12. The Sensible Bars, I have before observed, are formed by an inflection of the sensible laminæ, when they arrive at the heel, or termination of the lateral surface of the coffin bone, whence they pass obliquely forward to the sides of the sensitive frog.

13. The insensible part or hoof of the horse corresponds exactly in shape with the sensible parts which it covers and protects; in fact, the horny matter is formed by the parts which it covers; and has the same relation to them as the cuticle to the skin. This resemblance in form is easily demonstrated, by procuring a horse's foot as soon as it is cut off, and placing it in hot dung for a few days, or until the sensible foot can be readily separated from the hoof; thus a complete

The hoof consists of the wall or crust, the sole, the frog, the bars, and the insensible laminæ. The upper part of the crust, where it joins the skin, is named the Coronet; the lower part in front, the Toe; the sides of the crust are termed the Quarters; the quarters terminate in the heels, and the heels are connected with the frog. All resembles the under surface of a mushroom. terior and lateral surface of the sensitive foot; forming, as has been before observed, a very secure kind of union between the crust and the internal foot. The laming of the hoof are elastic, and yield in a small degree to the pressure of the horse's weight. They appear to be of a horny nature, and, like the hoof, void of sensibility, being a secretion or production of the sensible la-minz. The bottom of the hoof is formed by the m stened by a slippery fluid resembling joint oil, point is towards the toe, whence it becomes gra-over which the tendon passes immediately before dually wider and larger; it is divided by a cleft in its insertion into the coffin-bone. ON THE PRESERVATION OF PEACH TREES. Baltimore, 4th Month, 13th, 1824.

Respected Friend,

Agreeably to thy request, I now communicate a few brief remarks upon Peach Trees, and the simple method which I have so successfully tions of such insects as prey upon their roots.

in length, cream-colored, with a chesnut-brown, and somewhat depressed head. They had perforated the bark, generally about one inch beneath the surface of the earth, and were devourned by the surface of the earth, and were devourned by the surface of the alburnum and liber; whole season, in almost every stage of existence.

In the surface of the earth, and were devourned by the season, in almost every stage of existence.

From these facts the inference is irresistible. worms, and every thing that might retard the for the preservation of peach trees are entirely deeply interesting to the lovers and cultivators of the preservation, and left them—consoling myself with adequate.

I shall reserve that, and several other topicks, deeply interesting to the lovers and cultivators of fine fruit, for a future communication.

I am respectfully the friend he reflection, that they were safe during the The mode I shall here recommend, and which season at least. On returning home after an abence of about six weeks, I hastened to examine
to the condition of my trees, when lo! I per-

it becomes wide and expanded, there is a cleft or removing the worms throughout the spring, sum | four hundred trees, was first tried about three necessary to observe it in every state of its prothey appear, indeed, to be a continuation, as the with its natural history. To the mere entomolo-sensible bars are of the sensible laming. The gist, this would not have been a hard task; but crust at the heels appears to take a sudden turn, the vigilant attention it required, made it incom-

which I shall annex the tollowing description.

Abdomen blue, with one interrupted yellow band.

Legs and antennæ black.

premature decay of the trees, and above all, to devise the means of securing them against the evil.

Being particularly desirous of preserving some period their growth is accelerated or retarded in period their growth is accelerated or retarded in the period their growth is accelerated or retarded in the period their growth is accelerated or retarded in the period their growth is accelerated or retarded in the period their growth is accelerated or retarded in covered, and then apply the bandage as before growth that they had been growth before the period their growth is accelerated or retarded in covered, and then apply the bandage as before growthers that had been growthers that had been growthers. many others that had been very thrifty, I con- ed. In general, however, the pupæ are formed cluded to commence with them. On a careful early in the 10th month, (October) in the midst wounded crees, exceedingly and materially retard respectively a pientiful exudation of gum, from the three orders of the same tribe, in the 4th month, (April) and the beginning of the several minute apertures, which being opened by the pruning knife, displayed the lurking destroying the pruning knife, displayed the lurking destroying the larva appear in the 4th month, (April) aspected to it, to begin the sume the Nymph state, and accomplish their fisearch.

* When and in what manner these insects were cived with chagrin and dismay, a young and voracious colony of the same kinds of worms, laying waste what had been left by their predecesors. This fact demonstrated the inefficacy of the method heretofore recommended, of removing the earth from about the roots during winter. In the present instance, the owx must have cen deposited about the commencement of the lighths of an inch in length. It was evident rom this discovery, that I must either continue the tedious, fatiguing, and difficult practice of the worms from one.

* When and in what manner these insects were introduced amongst us, has never, that I know of, been understood.—I think, however, there can be introduced amongst us, has never, that I know of, been understood.—I think, however, there can be not doubt of their having been brought from the Northern and Eastern nurseries, for I never had a young tree from thence, that was not infested by them. All young trees, therefore, should be a present instance, the ovx must have early part of the 5th month, (May) after which it will only be necessary to renew occasionally. This will be a great saving of both time and labour, as it is easier to secure twenty trees, than to remove the tedious, fatiguing, and difficult practice of the worms from one.

years ago, embraces both prevention and cure. and is as follows:

Remove the earth from about the trunk of the tree quite down to the lateral roots, press with gress—in other words, to make myself acquainted the butt end of the pruning knife against the bark with its natural history. To the mere entomolo- in different places; if it appears to adhere from ly, and no gum nor moisture issues, a thin coat of the composition described below, may be applied patible with other duties, and I could only expect both above and beneath the surface, by a brush or wooden spatula, about two inches broad .-Then take Canton Matting, (or any other simiprocuring several aurelias, but these having ac-lar substance) cut into pieces of from 6 to 12 inchcomplished their final transformation, had all es in width, according to the size of the tree and escaped through an aperture in the vessel in of sufficient length to encircle it; bind one of Thave now finished the brief description I proposed to give of the horse's foot; to which the reader may refer, if he find any difficulty in comprehending the explanation that will be given of its diseases, and of the principles and practice of shoeing.

To the editor of the american farmer.

To the editor of the horse's foot; to which the were confined. Last summer I enthese around the part intended to be secured by two or three ties of twine or woollen yarn, so except two—one of which escaped, the othetation is diseases, and of the principles and practice of shoeing.

To the editor of the american farmer.

after the settlement of that part of the country; ding to the various articles of vegetable aliment, as corn, sweet potatoes, and rice, of which their diet chiefly consists. They also parch the seeds, and after bruising them in a mortar, make them into soup, which they season with salt and pepper. The seeds parched and ground with an equal quantity of cocoa, make an excellent chocolate.

The first public notice taken of the superior oil which the seeds yield, was by the late Mr. Morell of Savannah; who, in a communication to the American Philosophical Society, in the year 1769, and published in the first vol. of their Transactions, in 1771, observes that "the seeds make oil equal in quality to Florence, and some say preferable. Some say, one hundred weight of seed will produce ninety pounds of oil, others say less.* Romans; says, Capt. P. M'Kay, of Sunbury, in Georgia, told him that a quantity of the seed sent to Philadelphia, yielded him twelve quarts per bushel." This account has been confirmed by others.

oil, and also the utility of the leaves in dysentery.

Within two or three years, Mr. Few, of New York, but formerly of Georgia, commenced the business of expressing the oil for sale:-I have used part of one bottle, two years old, for sallad, during the last year, and can say with safety, that to my taste, it is equal to the finest olive oil ever tasted. Several bottles of it were also used at the table of the late President Jefferson during the last year of his administration, and much adproved of. The oil is clear and light colored, and somewhat thinner than olive oil. It has moreover this great advantage over the olive oil, that it does not become rancid by exposure to the air. The remains of the bottle used in my family last year, are now as sweet as when it was opened. This quality was long since remarked by Romans, who adds, that the second expression, which is procured by the addition of hot water, is muddy at first, but on standing, it will deposite a white sediment, and become limpid as the first running. The oil is at first of a slightly pungent taste, but soon loses that. Last year I received a half rice tierce of the seed, which I sent to Mr. Garnet of New Brunswick, to press, and hope soon to receive the oil from him*. Should it prove equal to that which I now have, I will use no other as an article of diet.

When we reflect upon the immense quantities of every species and quality of oil which are con-sumed in medicine, diet and the arts, we cannot entertain a doubt of the ready and extensive sale, and profit that would attend the cultivation of the Bene Plant.

Hitherto, the great profit attending the cul-

was introduced into S. Carolina and Georgia, by land fit for it, to listen to the suggestion of the the African negroes imported at an early period probable advantage to be derived from any other crops; but the circumstances of the world are and there can be no doubt of the plant having now changed. The great tracts of our country at been continued by them, for the purpose of ad- present devoted and devoting to the cultivation of prevent the dropping of the seeds. cotton, added to the political situation of the old world, has lessened the demand for the article. and consequently diminished the price of it. The late embargo too, which the unjust conduct of the warring powers of Europe forced the American government to adopt, and which deprived them of tended to, otherwise great loss will be sustained our cotton, induced France to grow it largely in our cotton, induced France to grow it largely in in cutting and removing the sheaves. In leading her southern regions, and to stimulate the Ita them to the barn from the field, care must be talians to a more extended cultivation of it than hitherto. In the last expose of the situation of seed which may shell out; and if a coarse cloth the country by the minister of the interior, it is be spread on the bottom, the quantity of seed sasaid hopes are entertained that France and Italy ved would be much increased. will be able shortly to supply all the cotton that the two countries may require. England also, besides her West Indies, will receive it from Africa, where great exertions are making to raise it, crush the seeds. I shall endeavour to supply this and whence too, it is known one or two vessels want, in a future number of this work. arrived last year in England with the first cargoes of the article; it is probable that the cotton of enlarged notice of the southern planters, solely on Africa, will be for some time inferior in quality account of the oil it yields; but it is also worthy to the cotton of the United States, but practice of attention by reason of the medicinal qualities will make perfect, and we shall not for a long of its leaves. This fact alone ought to entitle it time find any sale for our cotton on the continent, to cultivation on every farm in the southern and In 1805, I received some seeds from Georgia, owing to the powerful influence of the French middle states. The dysentery, a disease that freand placed them in the hands of B. M'Mahan, emperor; all these causes combined, must nequently ravages our country settlements, yields nursery and seedsman, for gratuitous distribution, cessarily diminish the price of cotton, and ought very readily to an infusion of the leaf in water. nursery and seedsman, for gratuitous distribution, cessarily diminish the price of cotton, and ought very readily to an infusion of the leaf in water. and in a paper in Doctor Coxe's Medical Muse-to show the planters of the southern states the In the year 1803, during an epidemic flux, which necessity of turning their attention to the raising raged with great violence in the upper country of of new articles of commerce*.

> sow the seed in holes about three feet apart, dropping ir each about ten grains, and when up the plants are to be thinned to three or four of the most promising. COMMUNICATION

CAROLINA AGRICULTURAL SOCIETY.

As a competitor for some of your premiums of first planting; they were often and well cultivaevery 4½ feet in the centre of the wide alley, and of this, two stalks were left in each hill. The of this, two stalks were left in each hill. ing sun.-The acre of gourd seed corn produced 67 bushels, 3 pecks, and 2 quarts of sound and merchantable corn, and 1 bushel and 15 quarts of corn was obtained 63 bushels and 5 quarts of sound and merchantable corn, and 2 bushels and bember last. An acre of similar natural land of gourd seed corn planted 5 feet square, 2 stalks in each hill, produced 16 bushels and 12 quarts; an acre of old land made of flint corn, 10 bushels and a half. The first crops of the manured acres of certificate I have brought for your inspection.

Although I am sure you will have larger crops state the quantity made from one acre of manured common country. land, and also the produce of two other acres of common land. The first was divided into sixteen beds each, fifty-one feet square, and planted every 12 inches square with slips. The acre contained 40,000 plants, and made two hundred and sixty-three bushels and an half peck. About 1-8th of this acre was planted with what are called sprouts, obtained by taking them from the roots as soon as fit to plant out. This part of the land was most productive and made at the rate of nearly 400 bushels to the acre. An acre of common land planted in the usual way, on 3½ feet I did not intend communicating to the public,

crops, is also submitted to you. From the first serving publicity, it may not be amiss to lay it week in June, to the end of the season, we had immediately before the public, and thereby expose To the Agricultural Society of South Carolina, little rain, and the acres of manured corn and potatoes suffered much. The corn fired to a experiments at once. The importance of a pregreat degree, and certainly was much injured. ventive to the washing of lands, all must admit; To THE PRESIDENT & MEMBERS OF THE SOUTH Planted in March, and early in April. This fact wash out. If a plan could be devised to obviate appears to demonstrate the difficulty of obtaining so general a misfortune, altogether practicable As a competitor for some of your premiums of the present year, I beg leave to state the result of two acres of high land, planted with corn, each two acres of high land, planted with corn, each ed universally thick. It appears as far as my And in order to effect so desirable an end. I acre 210 feet square; the one being old pasture experience extends, it cannot make a great crop, land, much exhausted, but had not been planted and if the season be dry and hot, it then suffers land, much exhausted, but had not been planted for a few years past. After being well cow-penned in the fall and winter of 1822—23, and ploughed up three times during that time, it was on the fall and winter of last, planted with flint corned to thick:—my opinion as to thick planting, would run the rows of grass parallel with the ed up three times during that time, it was on the 8th of March last, planted with flint corn however, appears confirmed from the last year's water course, and apportion their distances to the experience, for neither of the acres shewed any inches apairt, then an alley of 5½ feet. The stalks along the rows were not opposite each other of the acres shewed any indication of being too thick, until the serious would have a grass row at the distance of every stalks along the rows were not opposite each other of the acres shewed any indication of being too thick, until the serious would have a grass row at the distance of every stalks along the rows were not opposite each other of the acres shewed any indication of being too thick, until the serious would have a grass row at the distance of every stalks along the rows were not opposite each other of the acres shewed any indication of being too thick, until the serious would have a grass row at the distance of every six feet, and the corn to occupy the middle space two good rains in the early part of June, would run the rows or grass parallel with the water course, and apportion their distances to the experience, for neither of the acres shewed any indication of being too thick, until the serious would have a grass row at the distance of every six feet, and the corn to occupy the middle space two good rains in the early part of June, would be the corn to occupy the middle space but formed an irregular for more correctly and the corn to occup the middle space to the corn to occup the o stalks along the rows were not opposite each other, but formed an irregular (or more correctly an isosceles) triangle; no other manure was used but cowpen manure. The other acre planted with gourd seed corn, was the same which in 1822, had made 64 bushels and 5 quarts of flint corn; this received an additional manuring of 200 bushels of stable manure, and the same quantity of cotton seed since that crop. This was planted in the same way and on the same day as the other acre is cach acre containing 3000 stalks of this the land sould have admitted of: I believe I can with the grass; which of course, will give the have made the crops as good as the quality of the land would have admitted of: I believe I can with confidence state, that there is not on record any account of a great crop of corn, which was not planted universally thick, and generally speaking, the more stalks, the greater the crops, speaking, the more stalks, the greater the crops, the land be rich. I take the liberty to state I planted an acre of new land with unusual preparation in gourd seed corn; this from being also thick, and containing about 5000 stalks, suffered er acre; each acre containing 3000 stalks of this thick, and containing about 5000 stalks, suffered first planting; they were often and well cultiva-ted with the hoe, and twice with the plough. On One half of this quantity, with the usual labour the 5th of June, a second planting took place, bestowed on our new lands, would have been a good crop. While on the subject of corn planting fraction of levery two rows of crops thus: rows stood nearly east and west, so as to give the second crop, the benefit of the morning and even-exists among the best practical farmers even of the same neighbourhood, while some contend for a small number of stalks to the acre, say one stalk, four or five feet square, others prefer two unripe and rotten corn. From the acre of flint stalks the same distance—indeed the same remark applies with equal force to the other sta-ples of our State, Cotton and Rice. This con-5 quarts of unripe and rotten corn. The first trariety of opinion among the cultivators of each plantings were gathered on the 9th of September, and the second plantings on the 11th of Dewhether a premium should be offered for the whether a premium should be offered for the most conclusive experiment on a few acres of most conclusive experiment on a few acres of which still gives, as before, six feet distance to land, relative to each staple of our State, (the the corn rows. But should the hill's inclination as regards the number of stalks of corn, and cotton, and the distance of the rows of rice, and two rows of grass. corn were remarkably sound, there being but 7 quantity of seed rice to each acre;) I leave to quarts of rotten corn of the gourd seed; and only five quarts of the flint corn, as appears by the not consider the subject of sufficient importance to offer the premiums, you will at least receive Although I am sure you will have larger crops these few observations as an evidence of my wish of potatoes offered for your consideration, I shall to promote and advance the agriculture of our

To the Editor of the American Farmer.

TO PREVENT ARABLE LAND FROM WASHING.

beds, with the Red Bermuda potato slips, made through the medium of the press, my plan for 110 bushels and one peck; the other not far off preserving lands from washing by means of grass, in the same old cotton field, planted the same day till established on the broad basis of experience, with vines of the yam potato, made exactly the but, as you have published an allusion thereto, same number of bushels. The manured acre was which I incidentally made in a little communica-

measure, A certificate relative to each of these However, should you consider my theory de-

And in order to effect so desirable an end, I propose to establish permanent rows of grass,

But should the descent of the hill be more gradual, I would give the grass rows a distance of every two rows of grass; thus:

g. c. c. g. c. c.

It will be observed, there is a corn row on each side of the grass, at the distance of three feet, Society, however, stating the mode of planting be still less, I would give 13 feet to the grass rows, and have three rows of corn between every

Here the corn will have the same distance as before. The ground of course to be ploughed in but one direction. The grass must resist the rigors of winter, and have a perennial root, without spreading beyond the space allotted it. The kinds I prefer, from a partial experience, is the tall meadow oat and the Missouri grasses, and a tall winter reed grass. The Missouri and reed grasses are abundantly more nutritive than the oat. But my plan may be objected to, as superfluous, since the deep horizontal ploughing has been inthe one which made in 1822, 280 bushels and 3 too on summer grafting, I have concluded to ofpecks. Each acre was measured in the same fer you the plan entire; either, for present pubmanner as they were the last year, viz; each lication, or to lay by, till experience shall confirm jections, as it requires more capital and skill, than half bushel, heaped so as to be a lawful and just its utility. unabsorbent substratum, the crop must be in dan-

ger of drowning in wet seasons, while the ridges Thus you see what a singular world is our earth, must be somewhat inconvenient for a rotation of cropping; and lastly, the ridges can answer no For ever and aye giving opposite birth other purpose, than to save the land; for while they retain superfluous water in wet weather, from their exposure to the air and sun, in a drought, vegetation will suffer more than on an even surface. All which defects, my plan proposes to remedy, it is so simple, every farmer who can run a tolerable straight furrow, may adopt it, and is at same time, as cheap as simple. The grass will retain the water sufficiently long, to deposit its alluvion; but not long enough to injure vegetation. The grass will be as much be nefited by culture, as the grain, and will improve for years. So there will be a two fold intention answered; the land will be preserved from wash ing, while a large amount of hay and winter pasture may be obtained; while the crop of grass may not be any less, in consequence of this gram ineous acquisition. For independent of the waste of soil prevented by the grass, the water from hasty showers which would otherwise escape before the soil could have time to absorb it, will be retained, to the great benefit of the intermediate crop of grain. A winter grass is nearly stationary in the summer, always making its principal growth in the spring and fall, so that it will interfere but slightly, with those annual plants which are the chief object of cultivation.

When small grain is sown between the grass rows, the mixture of good hay with the straw, will add considerably to its value, while the grass seed, it mature, will blow off with the chaff ABNER LANDRUM.

B. HARWOOD, Tr. W. S. Md.

THE FARMER.

BALTIMORE, FRIDAY, APRIL 23, 1824.

The Tariff Bill has passed the house of representatives by a majority of five votes. In the senate it has been referred to the committee on commerce and manufactures.

The session of congress will probably not be closed until some time in June.

IF Mr. Randolph, an old fashioned republican, has moved to reduce the per diem of members of congress to six dollars per day: it is not expected

Mr. Edwards, late of the Senate U. S., Minister to Mexico, has while in Transitu for that place, revived against the Secretary of the Treasury, certain charges about suppressing documents, misplacing publick funds, &c., and avows himself the author of the famous " A. B." letters. -This is the third time the Hon. Secretary has been put in the crucible on this account-if he does not get scorched this time, he must be an odd fish-one of the Salamander family!

This number was going to press, before tober last. Notice is also given, that he has we discovered that Mr. Watterton's lecture on the obtained a patent for his improvement on the preservation of objects of Natural History, had cultivater or corn harrow, and likewise on the been omitted.

It is fairly within the scope of this paper, to present condensed views of all the great branches of American industry and wealth; for all emanate from, and have a bearing on Agricul ture. Even Fishermen cannot sail, and be subsisted on the ocean, without the farmer's timber for his vessel-his flax and hemp for her sailspork and his flour for their provisions .- We shall arrange for the next number, a view of the ex-tent and importance of our fishing privileges and trade, with an impressive and elegant delineation of its value in amount, and its tendency to generate those hardy and heroick qualities which characterise American seamen—we derive this interesting sketch from the able pen of the honourable and distinguished officer who prethe honour to generate those hardy and heroick qualities the honourable and distinguished officer who presides over the state department.

The Editor acknowledges the receipt of the following seeds for distribution, and gentlemen who wish the same for experiment, will

please make application at the Office of the Far.

Egyptian Millet, from N. Herbemonte, Esq.

Columbia, South Carolina.

North Carolina Field Pea, from Gen. C. Jones, of Raleigh.

THE VALUE OF THE FISHERIES.

As a distinct branch of American wealth and in dustry, and their effect on the physical powers. and moral character and qualities, of those em-ployed in them; from the pen of the honorable J. Q. ADAMS, Secretary of State.

EXTRACTS.

Let us now see what was the value of this fishery; this "doubtful accommodation of a few fishermen, annually decreasing in number."

From the tables in Dr. Seybert's Statistical

were upwards of seventy thousand tons of shipping employed in the cod fishery alone; and that in that and the four preceding years, the exports from the United States of the proceeds of the fisheries, averaged three millions of dollars a year. There was indeed a great diminution during the years subsequent to 1807, till the close There was indeed a great diminution of the war-certainly not voluntary, but occasioned by the state of our maritime relations with Europe, by our own restrictive system, and finally by the war. But no sooner was that terminated. than the fisheries revived, and in the year 1816, the year after Mr. Russell's letter was written, there were again upwards of sixty-eight thousand tons, employed in the cod fishery alone. From Dr. Seybert's statements, it appears further, that in this occupation the average of seamen employ ed is of about one man to every seven tons of shipping, so that these vessels were navigated by ten thousand, of the hardiest, most skilful, soberest, and best mariners in the world .- " Every person (says Dr. Seybert,) on board our fishing vessels, has an interest in common with his associates; their reward depends upon their industry and enterprise. Much caution is observed in the selection of the crews of our fishing vessels: it often happens that every individual is connected by blood, and the strongest ties of friendship. Our fishermen are remarkable for their sobriety and good conduct, and they rank with the most skilful navigators.'

Of these ten thousand men, and of their wives and children, the cod fisheries, if I may be allowed the expression, were the daily bread-their property-their subsistence. To how many thousands lives subservient? Their game was not only food entirely exempt from the danger.

and raiment to themselves, but to millions of other But we are told also that "by far the greatest

human beings. There is something in the very occupation of fishermen, not only beneficent in itself but noble and exalted in the qualities of which it requires the habitual exercise. In common with the cul-tivators of the soil, their labours contribute to the than twenty tons burthen, the proportion of which, subsistence of mankind, and they have the merit of continual exposure to danger, superadded to that of unceasing toil. Industry, frugality, patience, perseverance, fortitude, intrepidity, souls inured to perpetual conflict with the elements, and bodies steeled with unremitting action, ever grappling with danger, and familiar with death: ese are the properties to which the fisherman of the ocean is formed by the daily labours of his life. These are the properties for which he who knew what was in man, the Saviour of mankind, sought his first, and found his most faithful, ardent, and undaunted disciples among the fishermen of his country. In the deadliest rancours of national wars, the examples of latter ages have been frequent of exempting, by the common consent of the most exasperated enemies, fishermen from the operation of hostilities. In our treaties with Prussia, they are expressly included among the

Nor is their devotion to their country less conspicuous than their usefulness to their kind. In clear weather, near the shores, While the huntsman of the ocean, far from his native land, from his family, and his fire-side, pursues at the constant hazard of his life, his amost literally paved with them.

"All this was gradually making itself known the desire of the details of the content of the desire of the details." of our national arm did it not impart firmness and energy? We are told they were "annualty de-creasing in number:" Yes! they had lost their crease of power, the mine of wealth, the accuoccupation by the war; and where were they during the war? They were upon the ocean and upon the lakes, fighting the battles of their country. Turn back to the records of your revolution; ask Samuel Tucker, himself one of the number; a living example of the character common to them all, what were the fishermen of New England in the tug of war for Independence? Appeal to the heroes of all our naval wars-ask the vanquishers of Algiers and Tripoli-ask the redeemers of your citizens from the chains of servitude, and of your nation from the humiliation of annual tribute to the barbarians of Africa-call on the champions of our last struggles with Britain-ask Hull, and Bainbridge, ask Stewart, Porter, and Macdonough, what proportion of New England fishermen were the champions of their victories and sealed the proudest of our triumphs with their blood; and then listen if you can, to be told, that the unoffending citizens of the West were not at all benefitted by the fishing privilege, and more were the labours and the dangers of their that the few fishermen in a remote quarter, were

> part of the fish taken by our fishermen before the present war, was caught in the open sea, or upon our own coast, and cured on our own shores.' This assertion is, like the rest, erroncous.

as appears by Seybert's Statistical Annals, is about one-seventh of the whole. With regard to the comparative value of the Bank, and Labrador fisheries, I subjoin hereto, information collected regard to it; but not so situated were the provinfrom several persons, acquainted with them, as their statements themselves will show in their merchants of the sea port towns. They had beminutest details.

Extracts from a letter addressed by the honorable James Lloyd, of the Senate U. S. to the venerable John Adams, as is supposed, to whom Mr. J. Q. A. had applied for any information which might be amongst his papers, relative to the sub-

of Fundy, the Bay of Chaleurs, and the Gulf of the chorus of the colonial government in a cru-St. Lawrence, the Straits of Bellisle, and the sade against the encroachments of the infidels, Coast of Labrador, appear to have been designed the disbelievers in the divine authority of kings, by the God of Nature as the great ovarium of fish; or the rights of the provinces, and have pursued

with a stipulation, that in the event of war be- of the European continent. At the proper seatween the parties, they shall be allowed to con-son, to catch them in endless abundance, little tinue their employment without molestation. more of effort is needed than to bait the hook and

game upon the bosom of the deep, the desire of to the enterprise and vigilance of the New Enghis heart, is by the nature of his situation ever land fishermen, and for a few seasons prior to the intently turned towards his home, his children, year 1808, the resort to this employment had and his country. To be lost to them gives their become an object of attention, from the Thames, keenest edge to his fears; to return with the at New London, to the Schoodic; and boats and fruits of his labours to them is the object of all vessels of a small as well as a larger size, were Annals, it will be seen that in the year 1807, there his hopes. By no men upon earth have these flocking to it from all the intermediate parts of qualities and dispositions been more constantly the United States. In the fishing season, at the exemplified than by the fishermen of New Eng best places for catching the cod, the New England. From the proceeds of their "perilous and land fishermen, I am told, on a Sunday, swarmed hardy industry," the value of three millions of like flies upon the shores, and that in some of dollars a year, for five years preceding 1808, was these years, it probably would not make an over added to the exports of the United States. This estimate to rate the number of vessels employed was so much of national wealth created by the in this fishery, belonging to the United States, at fishery. With what branch of the whole body of from 1500 to 2000 sail, reckoning a vessel for each our commerce was this interest unconnected? trip or voyage, and including the larger boat Into what artery or vein of our political body did fishery; and the number, if the fisheries were it not circulate wholesome blood? To what sinew continued, would shortly be still further and very continued, would shortly be still further and very greatly extended.

mulation of capital, (for it has been justly observed, that he who draws a cod fish from the sea, gives a piece of silver to his country,) the effect upon the trade and custom of Great Britain, and the corresponding advantages to the United States, of which the enlargement of such an intercourse was susceptible, (for the stock of fish appears inexhaustible,) you are much better able to conceive than I am to describe; but I with pleasure point them anew for your consideration, as on many accounts presenting one of the most interesting public objects to which it can be di-

rected. Lucrative, however, and imposing in its individual and national bearings, as this fishery was and was to become, it was little known to the leading men of our country, and little spoken of by others, even in Massachusetts, or among those who were actually engaged in it, and a knowledge of its existence in any thing like its real extent, or future capability, was perhaps confined to not more than half a dozen heads, (if so many,) in the whole of the Southern and Western, and even

Middle divisions of the Union. "The causes of its value and importance not being a matter of great notoriety here, are obvi-ous; it was an employment not only in the fishery, but in many instances undoubtedly in trade, with the British inhabitants; those who were engaged in it made no unnecessary promulgations of their employment, while the poorer inhabitants of the provinces, tasting equally its sweets and advan-tages, were alike disposed to keep silence with cial governments, and the more wealthy of the come highly alarmed at the expansion of this fishery and trade; jealous of its progress and clamorous at its endurance; they, therefore, of late years, have repeatedly memorialized the government in England, respecting the fisheries carried on by the Americans, while the whole body of Scottish adventurers, whose trade both in imports ject in the negotiations of peace in '82-'3.

"The shores, the creeks, the inlets of the Bay curtailed, have turned out in full ery and joined classes of men "whose occupations are for the inexhaustible repository of this species of their objects so assiduously that at their own excommon subsistence and benefit of mankind;" food, not only for the supply of the American, but pense, as I am informed from a respectable source,

Europe, or returns to the United States; and this in some favourable position near the Straits of and haul their cod in a depth of water from 45 to fish, thus caught and cured, is esteemed the best expense in getting the fish to market abroad, as would in a short time have given our merchants a command of the European markets, and would have also afforded an encouragement to a small but very numerous boat fishery, which, from receiving the pay for their labour on the spot, could not fail to have been greatly excited and increased, and enabling the persons concerned in the exportation from the coast, to receive at home the a state fit to be exported from the United States; productive salmon and mackarel fishery, in the same vicinity, as most of the pickled fish we had received for some years prior to the war were caught on those shores.

AGRICULTURE.

TO THE AGRICULTURAL SOCIETY OF S. C. Charleston, 20th Nov. 1823.

GENTLEMEN-It would be presumption in me to offer any thing to your Society on Agricultural subjects; but as we are all interested in the health and prosperity of the low country, and the members of your society more deeply than others, I submit to you the result of my reflections on this, the chief object of my attention.

That this part of the State is more sickly now than formerly, I believe you will all agree; that it may become worse, is ascertained; and on the

As far as my observation goes, this increase of sickness commenced, with the abandonment of means of purifying the atmosphere were removed. I confidently hope that the evil may be arrested

That other countries have been ruined by the gradual deterioration of climate, can be proved by history; and the situation of Italy in particurice is cultivated on the banks of the Arno and the Po, although sickly, the prevalence of sickness is nothing, compared with that in the nemid-ocean, must expose them. They purchase salted clams for bait, which they procure at con salted clams for bait, which they procure at con siderable expense, and take with them from the rally the case by the middle or last of August, and again have been restored to United States. They fish night and day, when with which she then proceeds immediately to health by removing the sources of sickness.

may effect the improvements contemplated. in this part of the state? Where several are interested, they must assoknows that excellent crops have been made from minute.* it in avourable seasons. He reads of the system of draining and irrigation practised in China and other parts of Asia. He learns that a very cheap and simple machine may be used to flow when there is an excess of water. He purchases his neighbour's property for a trifle and removes the nuisance.* He makes certain preparatory to harvest.—You refresh the water has been left off cod.

Besides the draining of such cleared swamps, in wet clothes.

In other countries similarly situated, great attention is paid to diet, and I have no doubt of its advantages. All excess in eating and drinking is forbidden—the food should be abundant, nour-ishing and simple; the only restrictions generally observed are as to eggs, butter, and milk, as removes the nuisance.*

He makes certain preparatory to harvest.—You refresh the water has been left off food.

If any preventive medicine is necessarily medicine is necessarily medicine is necessarily medicine.

If from your own experience, you are satisfied of the great advantages resulting from your residence on your plantations throughout the winter, what must be the additional advantages of such superintendance in the Summer and Autumn-the most interesting and important part of the whole year.

PREMIUM PLOUGHS.

testing the qualities of ploughs, and suggesting a more favourable method.

FRIEND SKINNER,

I observed in the last number of the American Farmer, that the Committee of Arrangement have appointed the time when the next CATTLE Show for the Western shore of Maryland shall take place-for the exhibition of PLOUGHING MATCHES, &c -As I feel deeply interested with may inspect every thing, and obtain your supplies respect to ploughs and ploughing, the object of nel, and other weeds, turf and marsh mud, &c. without difficulty or delay. If two or three this communication is, to give some explanations the first cost of the land is the most conclusive families would unite in such a plan, it would of on those subjects, which I apprehend are not generally understood. They may serve as a gene-In making the choice, a pine ridge free from ral answer to a querry asked by many-some

> not only the luxuries and comforts, but even the with that the most laborious or expensive operations are performed. This circumstance induces the husbandmen to use great exertions to obtain the best.-Hence it is that premiums are offered for the best ploughs. Thus the mechanics have become excited; and great exertions are used to produce the best. Many very ingenious men, have undertaken to improve the plough, and spent much time and labour and means also, with a view to render that most important implement

^{*} This may be seen at Chisolm & Taylor's counting house. [The Editor of the Farmer has written for a drawing of said machine, to be en-graved and published for the benefit of his pa-

duced. Each competitor confident of his own, refractory, and unpleasant to work with. only just and right, but also very desirable.

with animal power, measured by time, is absothus the muscles are operated on, and produce that day, and can produce a plough any daythe animal feelings, such as the touch, taste, plough in the same time, and a like situation. smell, light, hearing, &c. Therefore the great-And if any advocates of the Brown plough, think er the excitement, the more exertion—conse-those assertions too bold, and will offer a suitable sequently the more power, or quicker the mo-opportunity, I hold myself bound to realize the tion. For instance, if we lay a sack containing fact, and should be much pleased to have a suitaone peck of wheat on a man's back or shoulders, ble opportunity to do so. But lest I may not be and request him to carry it one hundred yards, called upon to prove the case, I will just say without respect to haste or time, he will walk off I have had opportunities of comparing the Brown' very leisurely, and lay it down, without any pre-tension to haste; having been but little oppress-tested them very nicely, and know that it reed, he is but little excited—and on his return, if quires just about fifty-two per cent. more power we put a sack containing a bushel on his back, of draft to propel the Brown's plough than my with the former request, he will move off consi own. Hence it is, that I have an assurance to derably faster, and lay it down in more haste, use so much freedom-and again, to question the because the pressure affected the touch, and present, or former mode of testing ploughs, on so thereby produced greater excitement. But on small a scale, with animal power altogether. his return again, if we lay a sack containing four I look upon this as a subject of very material bushels on his back, which we desire him to importance, and really deserving the attention carry to the same place, that being about as of every man concerned in tilling the ground much as he can carry, he dashes off with all his and have no doubt, but all wish to know the might; and when at his journey's end, downs truth of the case exactly. Therefore, having with it as quick as possible.—In this case there challenged the present (or former) mode of is a double excitement—first, mentally, with a testing ploughs, I presume it will be expected, desire to please, in expectation of a favour or rethat I would propose some other, or a better ward-secondly, physically by the touch; being plan. As it is a subject that I am deeply interas much oppressed as the system is able to bear, ested in, and of course have reflected much upon, the excitement is as great as can be produced, I will suggest a plan that has occurred to my and of course, the motion as quick and as pow-mind—which is to take a field, I should not care erful as can be effected.

Again: if we attach a pair of smart horses to green sward, clover hay, stock or stubble ground; a plough, which will require just 300 lbs. power (indeed if it partook a little of all, it would afford of draft to propel it, (that is just about a hand the b st opportunity of realising the utility of the some draft for a pair of horses to draw,) they will implements,) have it struck out in lands of con walk off in their handsomest style, not disposed venient width, and then let the competitors ar to hurry or be refractory; because the pressure range themselves, and commence precisely at (or draft) does not affect the touch so hard as 'o nine o'clock, A. M.—take their lands alternately, produce much excitement.—But if we attach and plough just six hours, or until three o'clock them to a plough that will require 450 pounds of P. M. Then the committee, (aye and every bodraft to propel it, that is 50 per cent. more, which dy else.) would have an opportunity of judging of is really a very heavy draft for a pair of plough the operation of the ploughs to full satisfaction part must be completely pared away with a sharp

perfect. In order to give an idea of what has horses to draw, and more than they are able to both as to their performance, and the labour of

mentally; that is, the feelings of the mind (or choice out of five, can in six hours, or six months will) only—such as pleased or offended—love or envy, &c.—Or it may be excited physically, by the service of the serv

how rough or smooth, level or inclined, whether a

been done, it will suffice to say that there has draw, only a little piece at a time, they will have the teams in urging them along. And if the been upwards of forty patents taken for improve- to exert themselves so hard that their style will implements were kept in operation six hours, it ments on the plough. There are but few, how- be deformed. The touch will be so much affect- would also afford an opportunity of comparing ever, that are considered valid. The consequence ed by the pressure (or draft) as to produce great the performance of oxen with that of horses at is, that a great variety have been made and intro excitement—they will move too fast, be quite the plough; which with many very judicious farmers, is a subject of much speculation.- I have This renders it an important, interesting, and a very delicate subject for the agriculturist to deif the pressure or draft is so hard as to produce six hours, the result will be found very different cide whose is the best; and the more so, the pain, or be unpleasant to bear, it will excite the from what it would be, if continued only fifteen more valuable the premium when obtained. But animal so as to quicken its pace, and increase or twenty minutes—that there would then be the fact is, that some are better than oth- exertion.-Therefore in attempting to ascertain room enough to see through, so that all would be ers; and that some one kind are better than any the relative value of ploughs, by testing them fully satisfied-and then it would be seen, that other kind, or all the rest; and to ascertain with animal power, on so small a plat, or land, tests taken by the animal power in this way, which kind, or whose improvement that is, is not as the one eighth part of an acre, with reference would agree with tests taken by the Dynanometo time, is actually incorrect, and only calculated ter; by which I have no doubt that it is possible In the present common mode of testing ploughs, to deceive all who look to it with a view to ascer- to ascertain the difference in the draft of ploughs, the first thing is to obtain a nice smooth level tain the fact. Because there is no doubt, that if to a single per cent. But the great and imporpiece of ground covered with a stiff green sward, the teams are all of about equal strength, and tant object is, to have a proper opportunity of which is laid off in lands, or plats of about an under similar circumstances of about equal speed, judging of the teams I have seen an eighth of eighth, twelfth, or sixteenth part of an acre in and the ploughs will all cut and turn just the an acre ploughed with a pair of horses in about each. When the ploughmen have chosen their same sized furrowslices, the team that is attach twenty-two minutes; but the team was then so situations, the word is given—all start and urge ed to the plough of the heaviest draft, being efmuch exhausted, that I believe it could not have situations, the word is given—all start and urge ed to the plough of the neaviest arajt, being element of their teams all they well can; and he that gets fected most by the touch, or pressure of draft, ploughed another eighth in much less than an done first, if he ploughs the ground equally will be excited most, and consequently move the hour.—And another team of two horses with which an eighth of an acre was ploughed, in a pressure, that a little reflection will satisfy any eighth part of an acre, if it can hold out to finish, like situation, and in about the same time, that I scientific man, that this mode of testing ploughs, it will get done first. Here I will relate a circumstance that took less time than it did the first. And that there lutely incorrect.-Because in operations with place at the last cattle show for the Western may be so much difference as that in operating animal power, it is excitement that produces shore of Maryland. There was a premium with animal power, I have no doubt at all—and motion, not choice.—Excitement stimulates the mind (or will,) which commands the nerves—Brown plough. I had ploughs on the ground pair of good horses can stand its work, or use their greatest exertions about twenty minutes, motion. But the mind (or will) may be excited that a good ploughman with two horses, an equal but then they are exhausted-what could they

In testing ploughs, we may put an indifferent plough into the hands of a good ploughman, who by taking pains, will do good work—and again, we may put a good plough into the hands of an indifferent ploughman, and he will do indifferent work But after having ascertained which is the best plough, it is very rational to conclude, that, that is the plough with which any kind of a ploughman would do the best work. The object in awarding premiums is, that they should be given for the best implements, and not for the best work done with them, or the greatest quantity; especially in so short a time as fifteen or twenty minutes; but extend the time to six hours, and then it might be a better guess to measure the quality of the implement, even by time. But if we want to know which is the best, the only way to ascertain the fact is, to judge of the performance by the eye, and weigh the draft with an instrument adapted to the purpose, and that will give the exact result to a single per cent .- Then there could be but one opinion in the case; because the truth would be known.

Very respectfully thine, GIDEON DAVIS. Manufacturer.

George Town, (D. C.) 4th Month, 8th, 1824.

DISEASES OF DOMESTIC ANIMALS AND THEIR CURE.

Foot Rot. A disease in the feet of sheep, which is first discovered by the animal becoming lame. On examining the foot some ulceration will be found between the claws or hoofs, sometimes penetrating under the horn; when this is observed, the horn which covers the diseased

PHILO-HAMILTON.

Frederick County, April 3d, 1824.

[We have already published the Report of the Agricultural Committee, in Congress, mentioned supposed adversaries, its like the fighting of blind cocks; they are apt to pass each other without entertaining the spectators-we do not envy Hamilton his valiant friends, he deserves them; but surely no living writer was ever more ready to defend himself.

With respect to the Report of the Committee on Agriculture, we may here mention a fact, to shew the zeal and activity which characterises that side of the question. This report has been To mend the matter again, the very next hiere, sent to us by no less than seven correspondents FACTURES—being an official "statement of tive and valued friend, an honorable member the amount and VALUE of dutiable articles, ma- of congress, and had put it in the way of being nufactured annually in the United States, the published and preserved as a matter of course in amount of CAPITAL invested, &c." from which it is this journal, and we concluded that we could not give it better effect, or better stamp it with ortho-

> † Manufacturers were not then stigmatized, as greedy, improvident, and miscalculating builders of air-castles for manufacturing." Let him stand necessity of these "air-castle builders," and of those " wind mills that go by water," has become so evident as to induce a great man to do a great thing, especting them, I mean JEFFERSON himself.—Whether Ruris Consultus can ever possess the same magnanimity is of very little consequence to the manujacturers or their friends.

TO THE EDITOR OF THE AMERICAN FARMER.

BENE SEED-ITS CULTURE AND USE. Skidaway Island, Jan. 31st, 1824.

Your letter of the 19th, has reached me, wherein you request some bene seed for the purpose of venient to all the rest that are any way converbut so say not the great body of the farmers, and distributing among your friends who are desirous sant beyond the limits of their own particular so says not the nation; and they'll find my words of cultivating it; I have sent you, or will send true e'er congress rises, if their infatuation about you from Savannah, by the first vessel that sails Those whom necessity has obliged to get their the successor of our present worthy President thence for Baltimore, a small parcel of this seed, bread by manual industry, where some degree of don't prevent them from performing a most and should that not prove enough for your purposes, can let you have more. I have no doubt of so soon as the seed ripen you would be apt to loose caused repentance in any, except it was for their LAER as chairman, and whose voice may always them. The least agitation causes the pod to open be safely listened to by every farmer in these and the seed will fall, and in all probability be lost. The negroes in this part of the country are well aware of its virtues as a medicine; they likewise cultivate it for food; it is thought by them to be much better in soup than okra, and it is used by them in the same manner. I am told it is very good, but have never tasted it. You are well aware that oil of a superior quality, is extracted I shall conclude with what Plato says, lib. 7, above. The writer will see that we have omitted from the seed. Mr. John McQueen (whom you of his republic, with regard to the excellence and none of the argumentative part of his letter, and mentioned in your letter, and is now dead) told me that the oil was equal, if not superior to the olive oil; and the reason that he did not pursue the cultivation of it for that purpose, was on account of the difficulty of collecting the seed, bebest advantage : and it is remarkable, that all most part our readers prefer plain matter of fact ing obliged when cultivating it extensively to have it exposed to the winds, and more seed was lost than could be gathered. I am happy in being made useful in any manner towards improving the condition of my fellow beings, and in contributing my mite in promoting the cause of agriculture throughout our union, and at any time you may command my services as you may deem them useful.

With regard, yours, &c. ROBT. M. GOODWIN.

FROM THE AMERICAN JOURNAL OF SCIENCE, for June 1822.

Geological Survey of North Carolina.—We understand that Professor Olmstead of the University of North Carolina, will soon commence a series of geological and mineralogical observatious, intended, eventually to comprehend a scientific survey of the State. From the known intelligence, zeal, and scientific attainments of Professor Olmstead, we cannot doubt, that if adequately encouraged, the enterprise will produce very important advantages to science, agriculture, and the other useful arts; and will prove highly honourable to the very respecta-ble State of North Carolina. In no way, in our apprehension, could the same sum of money be more usefully expended; and it would be no small honour to have set the first example of the scientific survey of an entire American State. We hope then to see the next edition of the map of North Carolina,* present at least, the leading features of its geology, and mineralogy. It would be very desirable also, that the Botany, and if practicable, the Zeology of the country should be investigated at the same time.

* Price and Strother's map of North Carolina from actual survey, has great merit.

PROPOSALS

For publishing by subscription, a Practical Treatise, on the diseases of the foot of the Horse, containing a correct description of their

[.] For the meaning of this technical term, Ruris Consultus must apply to the Printer.

nature, causes, and methods of prevention, with suggestions of improved plans of treatment, founded on physiological principles. Also, rules of shoeing, by which the ordinary evils attending this process, may be in some measure prevented. Dedicated, by permissson, to General Charles Ridgely, of Hampton, by Richard Hayward Budd, Veterinary surgeon. Second edition, revised and improved by the author.

Taberg, N. Y. 12th April, 1824.

"Cannot you get some of your correspondents, to brighten the ideas, and improve the agriculture of the pioneers of the back and western country;

This work has been submitted to several genin the hands of every one who may own a horse, and regard the comfort and health of this useful course goes off. I am convinced by my short exbeen appreciated.

"Mr. Budd, we look upon, from the testimony of his book, to stand in the superior rank of Veterinary Surgeons, and he seems to be in need veterinary Surgeons. of nothing but the opportunities to evince his claim to the highest distinction of merit and utility in the professional line which he has DEAR SIR, chosen."

"We think this author's choice of subjects judicious, as confined to harticular accidental and difficult diseases of the horse, on which he gives the results of his own experience." "Tracts like these, of the practical experience of the author, are far more valuable at the present time, and ought to be in far greater request, than general Veterinary Treatises, with which the British public has been long since furnished to satiety." "We conclude with strongly recommending this book, not only on the score of its practical and professional ability, but for those traits of humanity and feeling, which are occasionally visible."

The above extracts from the Sporting Magazine, are sufficient to enable the reader duly to DEAR SIR, appreciate the merits of this work.

Bowling Green, 1st April, 1824.

DEAR SIR,

"The section of country in which I live, is yet young; too young for the labours of the husbandmen to have been carried to a great extent of wealth and profit. Efforts, however, are making to rouse a spirit of emulation, of honest competition, among the farmers. I am one of those who believe, the farming interest is the great interest ment may, at some future period, be staked upon the practical illustration of this principle. No man whose views have extended beyond the Alleghany mountains, could for a moment doubt the designs of providence, in regard to the vast regions of the western country. You are acquainted with the history of what we familiarly call the barrens of Kentucky. I live in the heart of them. There is no country in the world, with proper management and attention, more admirably adapted to all the purposes of the agriculturist. We want nothing now but a dense population and a spirit of enterprise and perseverance. The genius of improvement has not yet been at work among Our planters are slow in changing the rules us. and habits to which they have been accustomed from their infancy: and are too much disposed to say with the honest Dutchman, who ploughed his team through the deep and miry sloughs of the old, in preference to the greater conveniences of the new road-" mine fader drive here, and I drives here too." An agricultural society is now in contemplation in this place. Its constitution was formed a twelve-month ago, and we anticipate good from it. I circulate your paper among my friends, and nothing but the miserable, wretched condition of our currency, prevents a general subscription to it. We pray for better times. Newburyfort, (Mass.) April, 16, 1824. There is a point of depression surely, beyond Agriculture is at a low ebb here. Farms of which our affairs cannot go. I have no doubt we the best kind selling for 1-3 what fair price was have reached it. If you will send me a subscription paper, I will exert myself to add respectable

JAMES T. MOREHEAD. -0-

IF You would confer a great obligation, and perhaps an everlasting benefit, on a subscriber, by enquiring of your numerous correspondents, and publishing in the 'American Farmer,' a remedy for naturally weak eyes.

beating the best horses .- 1799 was sent to J. T. by Mr. Reeves to be sold, but died soon after.

81 .- 1811. Imported the b. h. Chance by Lurcher a celebrated runner, who beat Sir So-lomon, and the best horses in England. (See English Stud Book, and Racing Calendar.)

N. B .- Such horses were bred by J. T. as are ly, so soon thereafter, as his horses could be disposed of.

TO THE EDITOR OF THE AMERICAN FARMER.

NATURAL HISTORY.

DEAR SIR,

I send you herewith a Liverpool paper, containing an account of a lecture delivered, by Mr. W. Watterton, the re-publication of which, in your valuable Journal, may perhaps be usefulat all events, it is at your disposal.

3d April, 1824.

MR. WATERTON'S

NEW METHOD OF PRESERVING SPECIMENS IN NATURAL HISTORY.

[From the Leeds Mercury of January 10.] On Thursday evening, the Philosophical and Literary Society of this place, was honoured with a lecture, by Mr. Charles Waterton, Esq., of Walton-hall, the well known naturalist and traveller, on his new method of preserving speci-mens in Natural History. The disclosure of the lity, would cheerfully have remained for hours secrets, by which this gentleman has kept in perfect preservation, the fruits of his arduous and enterprising researches, and retained in the dead animal all the vivid colours, the perfect symmetry, and animated expression of the living, must be regarded as an important era in science. Such is the defectiveness of the old system of stuffing and preparing specimens, that no muse-um in the world can be considered as secure against the rapid progress of decay, or as pre-senting to the eye of the naturalist, real repre-sentations of the form and colours of the living animals. This truth has been admitted by the late Sir Joseph Banks, and other eminent naturalists, and such difficulties appeared to lie in the way of preserving quadrupeds (more particularly,) that the object had begun to be despaired of as unattainable. Mr. Waterton, who from his boyhood had a strong passion, not only for hunting and shooting, but for preserving the fruits of the chase, has pursued the study of Natural History with all the ardeur of genius, Natural History with all the ardeur of genius, and with unprecedented success. He has, several times, visited South America, for the mere purpose of obtaining the finest specimens of birds, reptiles, and other animals, unimpaired by the negligence or errors of the ignorant persons, through whose hands the ordinary specimens in our museums pass. His spirit of enterprise has carried him into the wildest, most unhealthy,

seum was already graced with a beautiful collection of birds, from the tropics, which Mr. W. handsomely presented about two years ago.

The lecture commenced at six o'clock in the evening, and lasted till after ten; and so lively was the interest excited, that the company, longer. He arranged his observations under three heads, considering, 1st. The nature of preserved specimens; how soon they perish by the moth; and how necessary it is to prevent them from falling into decay: 2d. The present defective mode of preparing specimens for muse-ums, which, being founded on wrong principles, is incapable of producing a good specimen: and 3d. The new method of his own invention. As he was a stranger here, he begged leave to mention, that he was born twelve miles from this town, and that as soon as he left the Jesuits' College, he made natural history his chief study. Sir Joseph Banks was pleased frequently to applaud his exertions, and that approbation encouraged him in his address to the society that evening. Under his 1st head, he observed that the moth

and most dangerous portions of this almost un- was very dangerous to the constitution; and explored Continent. He has plunged into the moreover, it could not be used in the new prodepths of immeasurable forests, lying beneath cess, on account of its soiling the specimens. Yet the equator, and peopled only by serpents and it was possible to prepare the specimens, so that wild beasts, where, adopting the habits of the the ant or the moth would no more touch them, Young Sir Peter Teazle, (bred by Lord Stamford,) was got by Lord Derby's Sir Peter Teazle; Lucy by has braved dangers which they dare not face, after it had been steeped in assafætida. Another Conductor; Lucy by Spectator; Blank, Childers, True Blue, Cyprus, Arabian Bonny Black.—(See English Stud Book, page 178.)

80.—1810. Purchased the celebrated imported horse, Magic; see the English Stud Book.

81.—1811. Imported the b. b. Chance by Lurcher. and Ritchie, and which has led so many favorite and be hatched after the atmosphere had dissisons of genius to their fate and to renown. The pated; so that furs could not be locked up for result of his dauntless perseverance is, that he many months together, without being destroyed has made himself master of a collection of spe-by successive generations of the moth. Finding cimens in Natural History, incomparably superior these methods defective, he next tried the wat-N. B.—Such horses were bred by J. T. as are not otherwise expressed. The racing memoranda have reference exclusively to such races as were run by J. T.—Those autecedent and subsequent to his ownership, as the performances of the recommendation of the such races as sequent to his ownership, as the performances of the recommendation of the such races as sequent to his ownership, as the performances of the recommendation of the such races as sequent to his ownership, as the performances of the recommendation of the such races are not otherwise expressed. The racing memoranda have reference exclusively to such races as were run by J. T.—Those autecedent and subsequent to his ownership, as the performances of the racing memoranda have reference exclusively to such races as well as the recommendation of the racing memoranda have reference exclusively to such races as well as the recommendation of the racing memoranda have reference exclusively to such races as well as the racing memoranda have reference exclusively to such races as well as the race of the racing memoranda have reference exclusively to such races as well as the race of sequent to his ownership, as the performances of Leviathan, Sir Archy, &c., are unnoticed.—J. T. tion of the secrets he had discovered. But the chiefly retired from the turf in 1809, and entire-ungenerous treatment Mr. W. met with at the trum—a mixture of alcohol (spirit of wine) with lungenerous treatment Mr. W. met with at the hands of Government, who when his dear-bought specimens were detained at the Custom-house, refused to allow them to pass without paying heavy duties, had so disgusted him, that he a spirit, and diffused itself rapidly through the relinquished his intention, and never made known his plans, till they were unfolded on Thursday last to the Leeds Philosophical and Literary Sonoticety. Mr. Waterton had frequently been solicited by Mr. Atkinson, the Curator, George Walker. Esg. of Killingbeck-lodge, and other part of the specimen, so that nothing was left on Walker, Esq. of Killingbeck-lodge, and other part of the specimen, so that nothing was left on members, to favour the Society with this inter-which the insect could feed; yet it did not in the esting disclosure, and he at length offered to least injure the colour or texture of the most decome over for that purpose. He visited Leeds licate specimen. (This Mr. Waterton proved, accordingly on Thursday, bringing with him by immersing in the mixture some of his most numerous specimens of birds, beasts, fishes, and a white ostrich feather, all of and reptiles, to illustrate his lecture. The mu-which in less than an hour regained exactly their former appearance.) With this liquid he tho-roughly washed the birds both inside and outside, after which they would keep in any climate or situation; the birds, tiger's skin, &c. thus prepared in 1812, were now as brilliant as at the moment when the operation was performed; and the liquid was equally efficacious when applied to all kinds of specimens—quadrupeds, birds, scaly animals, and insects.—To relieve, as he said, the dryness of these statements, Mr. Waterton here produced a large stock of Indian weapons,the bow, the lance, poisoned arrows, of various kinds, &c. the manner of using which he explained. By means of these, the Indians in the interior of South America, who had neither powder nor shot, killed their game, and obtained a subsist-ence; and Mr. W. himself principally used them in his expeditions into the forests and wilds

The 2d. part of his subject was on the mode at present in use of preparing specimens for museums. He declared it to be a had one, being founded on totally erroneous principles. He had visited nearly all the museums in Europe, and he must destroy them all at a blow; they were quite incapable of producing one good specimen. He related an ality no reason why the specimens might not be boldness of his censures, but ultimately became made to last as long as the table on which they convinced of their justice, on companies stood. Many ways had been tried to provide the specimens and the stood.

of being separated into several parts for facility of removal. Add to this—that the mechanical

time very cleverly executed, and Sir Joseph Banks declared that it was the best skinned bird in Europe; but it could not be compared for medy struck his mind, and it was a mere simple and describing the perilous conflicts he had in symmetry and expression to the latter. He alludeduction from facts and principles with which ded to the ignorant persons, through whose hands he had been familiar for 18 years. He did not ordinary specimens necessarily passed, who stuf-fed and stretched them, filled them with wires, and found it answer wonderfully well. The grand fed and stretched them, filled them with wires, and found it answer wonderfully well. The grand and disordered their plumage—plumage which discovery, however, he had made previously; it in life had been touched by nothing but the pure dew of heaven, or the soft breezes. For the pur- This he communicated some years ago to the Socoarse and clumsy were required, and that was all; any man might learn the art in a week: in stuffing, it merely required cotton for the birds, have made the discovery instead of him, they stuffing, it merely required cotton for the birds, and a piece of wood the size and shape of a knitting needle. This was the mechanical apparatus. But if you wish, said Mr. W. to excel in this art, if you wish to be in ornithology, in the art of stuffing birds, what Michael Angelo was in sculpture, you must apply to profound study, and call the society, and would never communicate with more own genius to assist you; you must the more He must state however, that he DEAR SIR. upon your own genius to assist you; you must have a complete knowledge of bird anatomy, could not fairly claim the entire credit of this discovery; he made it first, it was true, many great, that they cannot be supplied. It would its proportions, the curves, expansions, and depressions of its shape: in a word, you must have pressions of its shape: in a word, you must have the fire of animation and life into your prepared specimen. Then it would be necessary to visit the woods, the mountains, and the marshes, and to observe the feathered tribes, in their native to observe the feathered tribes, in their native abodes,—the kingly eagle, the roguish pye, the pert sparrow, the lazy vulture, the gentle and quadrupeds entire and in perfect shape, consisted amorous dove; each of which had its character. give several important instructions as to the pro-from the body but the mere external skin: he cess of stuffing, and to expose the errors of the then stuffed it as usual, and introduced a wooden present system. He said, that the feathers ought skewer or needle, which he called a working iron, to be kept close and smooth; that every bone into the inside, and thus pushed out the skin into to be kept close and smooth; that every bone into the inside, and thus pushed out the skin into should be taken out to the very beak, instead of precisely its proper shape. A difficulty, howev-leaving in, as it was usual, part of the skull; er, presented itself, as the needle would not work that wires should not be stuck into the birds, as easily amongst the oakum or tow with which neither their legs nor wings required it; that the orbits of their eyes which usually increased in that chaff or sawdust would answer instead of size from the shrinking of the surrounding skin, should be reduced to their natural size by needle and thread before the eyes were inserted. If the preparation was not made soon after the death of implicitly: before that period it was too soft, and the animal, the legs would shrivel, and the parts after that period it was too stiff; but taken at most thickly covered with feathers would dry in disproportionately to the others. It was not won derful then, that the specimens found in the most impression that might be wished. (Mr. W. here tive. By his new plan, the specimens of quadrupeds were made perfectly elastic, hollow system; the latter was shrivelled and disfigured; throughout, and without wires, yet preserving the shape and expression of nature. He then celebrated collections in Europe were all defec-showed a cat's head prepared last week, and con advised that those who built noble edifices for collections of natural history, should perfect their plans, by educating a man well, and sending him to foreign parts to procure specimens. As a second interlude, Mr. W. here displayed a fine specimen of the toucan, with all the gay colours of its beak and plumage preserved; a snake's muscles, features and limbs, might be accurately fine poisonous fangs of a serpent; and the toucan of a shark:—on each of which he related

deal of trash; and such institutions ought to like a mummy, on which account it was proposhave a person entirely devoted to their manage- ed by some to cut them off, and substitute wax for ment. Mr. W. showed two birds of the same them. Before he went the last time to South kind, one of which he prepared in 1812, and the America, he concurred with Sir Joseph Banks other in 1820; the former he considered at the in thinking that it was impossible to remedy this in Europe; but it could not be compared for medy struck his mind, and it was a mere simple was the solution—alcohol and corrosive sublimate. pose of dissection, a penknife and a hand not ciety of Arts and Sciences, who gave him at the the shape and expression of nature. He then lips, nose and ears being perfect.) To form the advised that those who built noble edifices for true shape of the nose, he introduced his working

easy of carriage, being quite hollow, and capable some interesting anecdotes, and gave instructive the large ant-bear, the calman (alligator), the armadillo, the land turtle, the tarantula spider, It was easy to dissect any animal, large or small, when the dissector was acquainted with its anatomy. Museums where presents were indiscriminately received, always contained a great greater convenience of package, he often separa-ted the animals into different parts, making the tail, limbs, &c. to fit on or take off at pleasure. By way of concluding the lecture, Mr. Water-

ton requested Dr. Williamson, the Secretary, to read a few passages from his journal, on the na-South America with a large serpent and a ferocious calman or alligator, both of which he secured and killed, without injuring them as specimens. These passages, from their striking and eloquent descriptions, excited the highest interest; and on the conclusion, three distinct and prolonged rounds of enthusiastic applause testified the admiration of the audience for the skill and gallantry of their lecturer, as well as for the valuable services which his discoveries had rendered to science.

referred you to the volume as I have not leisure to copy it. The same mode or nearly so, may be found in Speechly's work on the cultivation of the vine—and also in Martin's edition of Miller's Boistic expression, and that being lost it was no lon-by external sculpture. He cut away the gristle tanical and Gardner's Dictionary. But I prefer ger the same bird. Mr. W. then proceeded to from the nose and ears, and removed every thing Mr. Matlack's mode, beginning at the top of page 3, and ending near the top of page 7. By publishing it in your American Farmer, and recom-mending it to the different patriotic printers of newspapers, to give it an insertion. It would be the saving of thousands of dollars to the community, and increase the cultivation of the grape vine, four fold at least.

I have a letter before me, written by a gentle-man on the eastern shore of Maryland, who informs me that Mr. Eichelberger*, near York, Pennsylvania, was offered \$800 per year, for four acres of his vineyard. I have racked off my wine, and now have it fit for use, as much so, as new wine can be. It is beautifully fine and bright. There was 835 gallons put in the casks, and with leakage, evaporation, and lees, reduced it to between 690 and 700 gallons-near 30 gallons of the

Your's, respectfully.

TO THE EDITOR OF THE AMERICAN FARMER.

MAPLE TREE SUGAR. Washington, Pa. April 20, 1824.

DEAR SIR.

The honour done my hotch potch epistle of the 6th of March, by publishing it, was quite unex-pected. It was really intended only for your own pedlar's cart. I am, however, gratified to find you view the sugar tree in the manner it truly merits. It is one of "heaven's choicests gifts," vinegar, and sprinkled over with salt, and then bestowed on our happy country; but like many placing it in a carthernee with salt, and then bestowed on our happy country; but like many other blessings, shamefully abused. The farmers up, and changing the cloth, or ringing it out near this place sell nearly as much sugar tree, a-fresh, and again steeping it in vinegar once a shickory for fuel. It is equally valuable for this day, if the weather be very hot.

purpose. I know many families that make from twelve to sixteen hundred pounds of sugar annually, and rature be only moderate, be preserved without some go over two thousand pounds. The force required is one man, one boy with a horse and a leg of mutton will keep a fortnight. small sled, to collect the water; with occasional- A shoulder of mutton is, next to the shoulder of mutton is, next to the shoulder of mutton is a should be a sh ly a little extra help. In many instances the females of the family do all the work, except cut-ing and hauling the wood for fuel. A settlement in the northern part of Ohio, called the "western reserve," has justly obtained much celebrity for making large quantities of sugar. It is almost entirely settled by New Englanders, a people that matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound, speedily becomes and windows should be thrown open, and suffernation of the matter in which they abound the matter in which the matter in which the matter in in the northern part of Ohio, called the "western reserve," has justly obtained much celebrity for know how to make the best of every thing. A friend, at my request, has written to his brother, who lives in that settlement, for correct information on this subject; which if obtained shall be forwarded to you. I question much, however, whether any tree in the United States can exceed one that grows on the farm of Amos Walton, of the commencement of the putrefactive process takes place in the breast, and if this part is to be sent it is advisable to grant the commencement. West Bethlam Township, in this county. The produce of this tree for the last three years was tainted, by sprinkling a little salt and pepper produce of this tree for the last three years was a follows: spring of 1822, thirty-five and one-half pounds; spring of 1823, twenty-four pounds; and inside of a chine of mutton should be cut out, this spring twenty-nine and a half pounds; with a small portion of molasses each year. I had the part close round the tail should be sprinkled with above statement from a member of the family, salt, after having first cut out the gland or kernel. I am well acquainted with them, and know them to be very respectable. The tree is not of the largest kind, but has a very bushey top. It stands

very good.

I wish you to send me No. 46, of the 5th vol. of the Farmer, containing Mr. Bates' admirable address. So many of my neighbours borrowed to read this address, that they have literally read it to rage

near the head of a spring, without any other trees near it. The quantity made in this county this season falls short about one fourth. The quality

ON KEEPING OF MEAT,

AND BEST CONSTRUCTION OF LARDERS, PAN-TRIES AND MEAT SAFES.

Larders, pantries and safes, for keeping meat, should be sheltered from the direct rays of the sun, and otherwise guarded against the influence of warmth. All places where provisions are kept should be so constructed that a brisk current of cool air can be made to pass through them at command. With this view it would be advisable to have openings on all sides of larders, or meat safes, which might be closed or opened according to the way from which the wind blows, the time of the day, or season of the year; they should be kept, too, with the greatest attention to clean-liness. It will be better also if the sides or walls of meat safes are occasionally scoured with soap, or soap and slacked quicklime.

Warm weather, is the worst for keeping meat ; fected stables, for the purpose of purifying them. the south wind has long been noted as being hostile to keeping provisions. Juvenal, in his 4th Satire, says:

"Now sickly autumn to dry frost give way, Cold winter rag'd and fresh preserv'd the prey; Yet with such haste the busy fisher flew, As if hot south-wind corruption blew."

The best meat for keeping is mutton, and the leg keeps best, and may with care, if the tempebecoming tainted for about a week; during frost

A shoulder of mutton is, next to the leg, the joint best calculated for keeping in warm weather.

The scrag end of a neck is very liable to become tainted; it cannot be kept with safety du-

putrid, and then tends very much to infect the ed to remain so until the vapour is perfectly

adjoining part.

The chine and rib-bones should be wiped, and

In beef the ribs are less liable to become tainted than any other joint; they may be kept in a cool pantry in the summer months for six days,

and ten days in winter.

The round of beef will not keep long, unless sprinkled over with salt. All the glands or kernels which it contains should be dissected out.

The brisket is still more liable to become tainted by keeping; it cannot be kept sweet with safety more than three days in summer, and about a week in winter.

Lamb is the next in order for keeping, though it is considered best to eat it soon, or even the day after it is killed. If it is not very young the leg will keep four or five days, with care, in a cool place in summer.

Veal and Pork-a leg will keep very well in summer for three or four days, and a week in winter:—but the scrag end of veal or pork will not keep well above a day in summer, and two or three days in winter.

The part that becomes tainted first of a leg of veal, is where the udder is skewered back. The skewer should be taken out, and both that and the part beneath it wiped dry every day, by which means it will keep good three or four days in warm weather. The vein or hipe that runs along the chine of a loin of veal should be cut out, as is usually done in mutton and beef. The skirt of a breast of veal should likewise be taken off, and the inside of the breast wiped, scraped, and sprinkled with salt.

DISEASES OF DOMESTIC ANIMALS

Fumigation. The extrication of certain vapours from nitre, salt, or other substance in in- 32°, W.

Many preparations have been recommended for fumigation; only two of them, however, appear to be worth notice.-1st. In a large dish of hot sand, place a cup or other vessel with some powdered nitre in it; pour upon the nitre a quantity of oil of vitriol, equal to half its weight. No person can remain in the stable while this proter leave the stable; as the fumes from this mixture are far more suffocating than the for-mer, but certainly more effectual. In one expe-riment, I found that the infectious property of glanderous matter was destroyed by being expos ed to this vapour. Before a stable is fumigated, all litter, hay, dust, &c. should be swept out; and the whole stable well cleaned. The rack, manger, and wood-work between them should be gone.

Gall or Bile. A yellowish, bitter juice se-creted from the blood by the liver. In the human liver, as well as in many quadrupeds, there is a reservoir, where it is deposited for a time, named Gall-bladder; but this does not exist in the horse. The gall is conveyed by the biliary duct to the duodenum, or first intestine, where probably it is concerned in the separation of chyle from the digested food: and serves afterwards by its irritating or stimulating quality, to promote that peculiar motion of the intestines, by which their contents are gradually propelled

towards the fundament.

Editorial Correspondence.

Extract of a letter dated King Creek, S. C. April 2, 1824.

e a c mb

pu tr th mi pu hij Ph for ge 50,

During the last summer a fire was kindled in the evening in my garden on a small stage, which was kept burning in a blaze till bed-time. In consequence, vegetables in it were less annoyed by insects than in neighbouring gardens. Countless numbers of these little provoking invaders which the light seemed to put in motion, directed their flight towards the blaze, in which they met with sure destruction. By this cheap and easy method the mature and vigorous were destroyed, and their

numerous increase checked.

To keep meat and at the same time to preserve the juices during the summer months, I have resorted to various expedients. In all my intention has been defeated whenever the range of the thermometer has been above 72° on Fahrenheit's scale. The summer heat here plays between 80° and 93°.* I have thought of a little apparatus that promises success in the most rarified atmosphere, but workmen here are wanting to construct it. A description may not be uninteresting. It is a glass tub having a metal cover to fit with a screw, at the termination or lower part of the screw, a projection entirely around the tub of an inch in width, the upper surface of which to be a horizontal plane, on which a soft piece of leather

* This is the excess of heat, and takes place between noon and 3 o'clock, P. M. generally. Lat. the cover when screwed on will press upon it, the more effectually to exclude the admission of air between the tub and cover. The centre of the cover to have a small opening over which an air pump is to be made fast—the opening to be armed with a valve to prevent regurgitation of air into know in what light we are viewed by others; as inch. I was obliged to leave town, for Sir the tub after its being emptied by means of the well for the removal of prejudice if it exist, as Charles Morgan's annual cattle show in Wales, pump. The principle scarcely needs explanation. for the reformation of actual defects and abuses; before the beef was painted, or I would have tapump. The principle scarcely needs explanation. for the reformation of actual defects and abuses; before the beef was painted, or I it is to protect the meat from the constant action in this view we have published the preceding ex-ken care and had it better done." of air, one of the agents necessary in the putre. in this business.

This little contrivance placed in a convenient apartment, may be visited at pleasure by the cook, who after one lesson would be qualified to DEAR SIR, attend it, will not only save labour and the ex-pense of salt necessary to keep meat in any other our agricultural work of the spring; many of my out, and the meat then suffered to remain till the salt has penetrated through it.

FROM THE NEW YORK AMERICAN.

The following translation of an epigram of Philodemus, preserved in the Greek Anthology, shows that in one respect, at least, women have altered very little in a lapse of 2,000 years.

While flush'd with wealth, what restless love possessed you? But now you wisely cease to burn, when poor—
Hunger your best, indeed, your only cure;
And that sweet girl of your's, who oft caressed you,
And by each fondest, dearest name address'd you,
Will now with strange, and careless glange inquire,
"Good Sir, your name—whence are you?—who?

"Good Sir, your name—whence are you?—who's your sire
There's something foreign in your air, I'm sure."
The world will teach you, if you but attend,
"He who has nothing must not hope a friend."

INVITATIONS TO DINNER.

In " the affairs of the mouth" the strictest punc tuality is indispensable; the GASTRONOMER ough to be as accurate an observer of time, as the As TRONOMER. The least delay produces fatal and irreparable misfortunes.

Almost all other ceremonies and civil duties may be put off for several hours without much inconvenience, and all, may be postponed with-out absolute danger. A little delay, may try the patience of those who are in waiting; but the act itself will be equally perfect and equally valid. Procrastination sometimes is rather advantageous than prejudicial. It gives time for reflection; and may prevent our taking a step which would have made us miserable for life; the delay of a courier has prevented the conclusion of a convention, the signing of which might have occasioned the ruin of a nation.

If from affairs the most important, we descend to our pleasures and amusements, we shall find new arguments in support of our assertions. The putting off a rendezvous, or a ball, &c. will make them the more delightful. To hope, is to enjoy.

"Man never is, but always to be, blest."

The anticipation of pleasure warms our imagination and keeps there feelings alive which

tion, and keeps those feelings alive, which possession too often extinguishes.

> "'Tis expectation only makes us blest; " Enjoyment disappoints us at the best."

Dr. Johnson has most sagaciously said: " such ten times as well. is the state of life, that none are huppy but by the anticipation of change: the change itself is noth-of Wines, Liquours, Ices*, Desserts, &c.-

converts of our readers, and convinced the "amateurs de bonne chere" of the truth and importance of our remarks; and that they will remember, that DINNER is the only act of the day which cannot be put off with impunity, for even FIVE MI

In a well regulated family, all the clocks and watches should agree; on this depends the fate of the dinner; what would be agreeable to the stomach, and restorative to the system, if served at Two o'clock,-would be uneatable and indigestible at A QUARTER PAST.

The dining room should be furnished with a good going clock; the space over the kitchen fireplace with another, vibrating in unison with the former, so placed, that the cook may keep one eye on the clock, and the other on the spit, &c. She will calculate to a minute the time required to roast a large capon or little lark, and is equally attentive to the degree of heat of her stove, and the spit, and the stew from the pan.

With all our love of punctuality, the first consideration must still be, that the dinner "he well done, when 'tin done."

It is a common fault with cooks who are overanxious about time-to overdress every thinglow his cook-her quarter of an hour's grace.

The old adage that "the eye is often bigger around it;—his principal inducement to leave his can the belly," is often verified by the ridiculous own fire side, is the charm of agreeable and instructive society, and the opportunity of making connexions, which may augment the interest and

> It is the most pleasing part of the duty of the master of the feast, (especially when the guests are not very numerous,) to take advantage of adroitly laying hold of those ties of acquaintance-ship or profession which may exist between them. This will much augment the pleasures of the festive board,—to which it is indeed as indispen-

sable a prelude as an overture to an opera: and the host will thus acquire an additional claim to the gratitude of his guests. We urge this point more strongly, because, from want of attention to it, we have seen more than once, persons whom Swift told Pope, he was obliged to pay for it in many kindred ties would have drawn closely to-Ireland—"I should hardly prevail to find one vi-sitor, if I were not able to hire him with a bottle lips to each other, because they were mutually of wine."

To put an end at once to all ceremony as to the order in which the guests are to sit, it will save

It is your SECOND COURSES—ridiculous variety ment has been introduced in placing the company at a dinner table.

The ladies first take their places, leaving in-tervals for the gentleman; after being scated, each is desired to call on a gentleman to sit beside her; and thus the lady of the house is relieved from all embarrassment of etiquette, as to rank and pretensions, &c.

But without doubt, says the Journalist, this method has its inconveniences.

"It may happen that a bashful beauty dare not name the object of her secret wishes, and an acute observer may determine, from a single glance, that the elected is not always the chosen.

If the party is large the founders of the feast should sit in the middle of the table, instead of ly arranged at least an hour before dinner time.

The cook's labour will be lost, if the parlour table be not ready for action, and the eaters ready for the eatables—which the least delay will irre-carring—will have an opportunity of administering all those little attentions which contribute so

If the GUESTS have any respect for their HOST, or prefer a well-dressed dinner to one that is spoiled, instead of coming half an hour after, they will take care to make their appearance a quarter

clock,-the moment the roasts, &c. are ready, they must go to table, if they are to be eaten in perfection.

An invitation to come at Five o'clock, seems to be generally understood to mean Six; Five PRECISELY, half past five; and NOT LATER THAN FIVE, (so that dinner may be on the table within ten minutes after, allowing this for the variation

cially if it be not accepted-then, in addition to

&c. the best possible reasons must be assigned for the non-acceptance, as a particular pre-engagement, or severe indisposition, &c.

Nothing can be more disobliging than a refusal which is not grounded on some very strong and unavoidable cause, except not coming at the appointed hour; "according to the laws of conviviality, a certificate from a Sheriff's Officer, a Doctor, or an Undertaker, are only the pleas which are admissible. The duties which invitation imposes, do not fall only on the persons invited, but like all other social duties, are recip-

It is the least punishment that a blundering illbred booby can receive, who comes half an hour after the time he was bidden, to find the soup reoffence, let him also be mulcted in a pecuniary which his dish bears to the number he has to penalty, to be applied to the FUND FOR THE BE- divide it amongst,—taking into this reckoning, the NEFIT OF DECAYED COOKS. This is the least quantum of Appetite—the several guests are prepunishment that can be inflicted on one whose sumed to possess. silence, or violation of an engagement, tends to paralyze an entertainment, and to draw his friend into useless expense.

BOILEAU, the French satirist, has a shrewd ob-servation on this subject. "I have always been punctual at the hour of dinner," says the bard, "for I knew, that all those whom I kept waiting at that provoking interval, would employ those unpleasant moments, to sum up all my faults. BOILEAU is indeed a man of genius—a very honest "The guest who wishes to insure a hearty wel man;—but that dilatory and procrastinating way come, and frequent invitation to the board of

I once heard a gentle hint on this subject, given to a bluemould fancier, who by looking too long at a Stilton cheese, was at last completely overcome by his eye exciting his appetite, till it became quite ungovernable and unconscious of every thing but the mity object of his contemplation; he began to pick out in no small portions the primest parts his eye could select from the centre of the

The good-natured founder of the feast, highly amused at the Ecstacies each morsel created in its passage over the palate of the enraptured gourmand, thus encouraged the perseverance of his guest-" Cut away, my dear sir, cut away, use no ceremony, I pray:—I hope you will pick out all the best of my cheese—THE RIND and the ROTTEN will do very well for my wife and familu!!"

Half the trouble of WAITING AT TABLE may be saved, by giving each guest, two plates, two knives and forks, two pieces of bread, a spoon, a wine glass, and a tumbler, and placing the wines and sauces, and the MAGAZINE OF TASTE, as a dormant, in the centre of the table; one neigh-

bour may then help another.

Dinner tables are seldom sufficiently lighted, or attended-an active waiter will have enough to do, to attend upon half a dozen active eatersthere should be half as many candles as there are guests-and their flame be about 18 inches above the table -our foolish modern pompous candelabras, seem intended to illuminate the ceiling, rather than to give light on the plates, &c.

AGRICULTURE.

the "Agricultural Society of the Valley" at a meeting at Winchester, in Virginia, resolved to have recorded in the American Farmer, such of the papers as might be read at their meetings, as might be deemed worthy of preservation, and promulgation, for the information and use of their brother agriculturists .-In execution of that resolution, we have given in this number, a paper on the culture of Indian Corn, from the pen of William Barton, Esq. vice-president of said society; and shall continue to publish such as may be put into our hands, until the whole shall have appeared in one connected series.]—Edit. .1m. Fnr.

PAPERS

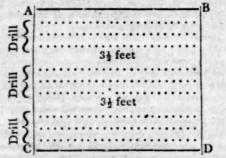

Read at the last meeting of the Agricultural Society of the Valley, and by request of said Society, communicated for publication in the American Farmer. No. 1.

DEAR SIR,-Some weeks since, I expressed my intention to communicate to the Society of the Valley, the system pursued by the Messrs. Pratts, of New York, in the cultivation of corn, which was attended with such extraordinary

In October, 1821, they broke up to the depth of nine inches, a field containing three acres, which had been fifteen years in meadow. In the ensuing spring, they ploughed it twice, and harrowed it three times, by which process it was fully prepared for drill furrowing. These drills were formed by turning two furrows together, the lines of the coulter running at the distance of eighteen inches. The drill being thus opened, returned to its original situation. An intermediate furrow, distant nine inches from each of the a stalk, and the three rows are taken collectively,

Leaving an interval of three and a half feet, and other implements of cultivation,) three other adjacent rows are prepared in the same manner as the above, and so on, throughout the whole extent of the field. Thus, upon every space of market price of the commodity. five feet in breadth, stand three rows of corn:

Your's very respect and it may be readily calculated, that upon one acre there will stand one hundred and thirty-six rows, each row consisting of four hundred and fifteen stalks; making the aggregate of fifty-two thousand, two hundred and ninety stalks per acre. Now, imagine that three-fourths of the stalks will attain such a degree of perfection, as to produce one ear of corn only, and each ear affords but a single gill, you will have the quantity produced by the Messrs. Pratts. That this arrange-ment may be perfectly understood, I annex a plate of the field, which is here designated by the letters A, B, C, D,

The drill is made by two furrows, which open it to the width of 18 inches: 3 rows of corn to a drill, 1 upon each edge, and 1 in the middle. wards dressed with a solution of blue vitriol or These rows consist of a kernel dropped every 6 inches.

To this lot the Messrs. Pratts applied 144 loads ed. of manure, and although this will at first appear to be an expensive and laborious system of cultivation, yet, when we recollect the prodigious quantity of provender, as well as of merchantable corn which results from it, we must regard the proprietors as having been fully compensated for the labour and expense of tillage. On a former occasion, the product of this spot was stated to have been 502½ bushels; and it may now be proper to repeat that the fact is supported by the most satisfactory and unequivocal evidence.

The Messrs. Pratts unite with almost every farmer of the north, with whom I have conversed, in recommending deep fall ploughing for corn. In addition to this, they advise shallow planting, with the preservation of a level surface during its cultivation. These opinions are not founded merely on theoretical reasoning—they are the result of repeated and successful experiments.

Mr. Gerrit Smith, (a gentleman to whom I feel indebted for much useful information) vice-president of the society of which the Messrs, Pratts are members, describes the soil they cultivate, as one in which clay predominates; but as the adjacent country is generally sandy, it is not improbable that this also enters into its composition.

Some will probably doubt the propriety of exopinion on a subject of so much importance to the agriculturist, until they have given it a fair and experimental investigation. If, by reducing the labour and expense of cultivating fifty acres, to the limits of ten, we receive the same quantity

each stalk will stand at the several distances of vation, this should certainly not operate as an legs, (particularly the hind-legs,) which by their six and nine inches from the most contiguous ones. apology for that hurried and inefficient mode of situation are most remote from the centre of circucultivation which never repays the labourer even lation, and through which the blood has to return (which space is sufficient to admit the plough for his trouble. From what I have heard and in opposition to its own gravity, become swelled personally observed in our own county, I would for want of the accustomed absorption. On the hazard the assertion, that the corn made by nine- other hand, when the horse is lean and emaciated, tenths of our farmers, cost them more than the either from a want of a sufficient quantity of nu-

AND THEIR CURE.

Glauber's Salt, Sulphat of Soda. This is an inconvenient purgative for horses, on account of inconvenient purgative for horses, on account of which period the grease is most prevalent, the the large quantity that is required to produce any insensible perspiration of the body is neither considerable effect. The best mode of giving it is to dissolve about a pound and a half in a pail of water, and allow the horse no other liquid until he has drunk it; which he will generally do the expiration of vapour from the lungs; and in the course of a day. Cattle are purged by a smaller quantity than horses; the dose for a cow is from twelve to sixteen ounces dissolved in horse remained in a state of nature. But it is far gruel.

Gravelling. A bruise in the foot from gravel being lodged between the shoe and sole; this most commonly happens near the heels, and particularly to horses that have corns. The shoe is to be taken off, and the horn covering the bruised him to proceed in his labour at the moment part pared away carefully, so that when the shoe when the fullness of the bladder stimulates him Friar's balsam. When the bruised part is very tion carried on, without putting nature to the tender and inflamed, a poultice should be application of any corporeal powers. The bad ef-

horse's heels, sometimes extending upwards, even tion, probably 18 hours out of the 24. The to the knee or hock joint. On examining the pavement of the stall being on an ascent, will part, it will be very hot and tender. These throw three fourths of the weight of the body symptoms are soon followed by a discharge of on the hind legs, and will also distress them stinking matter from the heels. The disease by the toe being placed upon higher ground than most commonly attacks the hind legs, but the the heel, whereby the ligaments and membranes fore-legs also are liable to it. The animal appears to suffer considerable pain, and when first moved he suddenly catches up the affected leg, ture of the skin eventually takes place, and a (when it is the hind leg) as if he were crampserious discharge ensues, which by exposure to ed, and keeps it in that position a short time, the atmosphere acquires a fetid and acrimonious hopping about, when forced to move, upon the quality. As the disease advances, the part afopposite leg. This he often does also when both hind legs are affected, drawing up that which is as to give excessive pain to the animal when he most painful. Grease is generally a local disease, moves the limb; at the same time the excoriation but it sometimes appears to depend on general spreads, destroys the roots of the hair, and creor constitutional derangement. Grease is produa foul habit of body; and bleeding, purging, and of Grapes. I have been induced to give Mr. rowelling, are the remedies commonly employed; Lawrence's explanation at some length, because but Mr. R. Lawrence very justly observes, that it appears to possess the merit of being ingenious this mode of treatment is not always attended and original. According to Mr. Feron, grease is with success, and he considers debility in the often produced by sudden changes from cold to system to be generally the original cause of heat. "If," says he, "a colt is taken from Grease, though other circumstances may concur grass and immediately kept in a warm stable afin its production. Debility, he observes, may ter having been used to the severity of the atmospending so much labour and manure, on so small arise from directly opposite causes, viz. repletion, phere, he then gets the disorder. When old a surface; but I trust they will suspend their and exhaustion. The healthy state of all animals is constituted by a due and regular circula-find that their feet have been exposed first to tion of the blood, and a uniform maintenance of cold and afterwards to heat, as when they have the natural evacuation of the body. Whatever been in cold water or snow for some time, and on disturbs any of these functions will produce coming into the stable have a large bed of straw debility. In a full plethoric habit, the ves- or perhaps hot dung to stand upon. This sudden

tritive food, or from excessive labour, the circulation of the blood will be languid from a deficiency of stimulus, and bebility will naturally ensue. In addition to either of the above mentioned causes, he thinks the following may be given as collateral promoters of the disease; viz. the season of the year, unnatural confinement in the stable, the acclivity of the pavement of the stall, cutting the hair off the heels, and want of proper exercise and cleaning. In the winter season, at so regular nor so profuse as in the summer; but nature generally provides against this de-crease by increasing the discharge of urine, and this mode of expulsion would be fully sufficient for the purposes of the animal economy, if the different with him in a domesticated state, in which he is alternately exposed to a cold and warm atmosphere, as he is within and without the stable. The secretion and evacuation of urine are disturbed in their process by forcing when the fullness of the bladder stimulates him is put on again, the tender part may not receive any pressure. The same object may often be accomplished merely by hollowing the shoe. Should matter form, the horn must be pared away so as to give it free vent, and the part afterportionate debility; whereas the insensible perportionate debility; whereas the insensible perportionate debility; whereas the insensible perspiration is a tranquil and imperceptible evacuaexpense of any corporeal powers. The bad effects arising from the foregoing causes are consi-Grease. the grease in horses." The cause to which Mr. IMPORTANT IMPROVEMENT IN COT-|copious and rapid flow of sap, a correspondent in-Feron ascribes grease is certainly a very com-mon one; and it cannot be disputed, that grease may take place under two very different states of the body, viz. general weakness from excessive exertion, aided by local causes, and plethora from over feeding and insufficient exercise; and it is probable, that the declivity or slope of the ground, on which the horse stands, may, by throwing an undue proportion of his weight on the hindlegs, contribute to the production of the disease. If a horse when attacked with grease is in good or decent condition, has no appearance of weakness, and particularly if the pain and inflamma-tion are considerable, bleeding is certainly proper; and after cleaning the affected parts, a large saturine poultice should be applied. If the horse is in any degree costive, a mild purgative should be given; if not, I would rather advise the use of mild diuretics, in the form either of balls or powders. When the poultice has been properly applied for a few days, the inflammation SIR will generally be lessened considerably, and then some mild astringent lotion may be useful, as a thorize the liberty I now take to address you ;where the hair about the affected part stands Plant, by which the malady called the rot, so ment before stated, consists in obstructing the erect, and the matter which is discharged apostern destructive to the hopes of the planter, and circulation of the sap in its descent through the pears somewhat like dark coloured or dirty was that hitherto seems to have baffled all attempts to stem or branches of the Cotton Plant, without deter, and has a peculiar fetid smell; and when arrest its ravages, may be prevented—the matuthe animal at the same time seems to suffer great

crement of wood, and a constant succession of flowers and capsules; a portion of which do not arrive at maturity. Now if the circulation of sap southern readers in the last number of the is stopped in its descent through the bark, it must American Farmer, we have been favoured with necessarily be subjected to less violent action upa copy of the following circular, by an eminent on any excess of stimulus, and more perfect ela-planter to whom it was addressed. The name of boration in the branches and foliage, by a prothe patentee in this case is already familiar to tracted exposure to light, heat and other influenour readers, as the author of the essays on flax, ces of the atmosphere; while the leaves, exerhusbandry, and other communications of great cising their proper functions, perspire or evapointerest and value; and in this case the impor- rate the excrementitious and aqueous parts; the tance of the subject is of itself sufficient to gua-rantee prompt attention, fair experiments, and zation, is absorbed and evolved by the flowers a candid exposition of the results; which, we and capsules; rendering them at all times vigo-need not say, we shall be very happy to record rous and able to withstand the vicissitudes of sea in the American Farmer. For description of sons, the action of insects, and to repel the formidable parasitic tribe that float in the atmosphere, ready to fix upon weak or diseased vegetation, and complete its destruction. Moreover, the plant being, in a great measure, deprived of the means of propagating the viviparous or wood progeny, its energies are directed to the oviparous or sexual; accordingly the main force of vegetation is employed to increase and perfect the

You will now understand, Sir, that the improvefacility, that a common labourer, it is believed, On examining the staple of mature Cotton with a high magnifier, it will appear that the filaments are tabular, having lateral pores or cells, communicating with the longitudinal tubes, and contwo knives of alliptical form, for making the for making the vertical cuts, having its edge at right angles, and even with the edges of the horizontal knives. The operator grasps the stem with the instrument, and by a gentle pressure, which a spring between the handles enables him to regulates, the strip to be removed, is divided on each side, when by turning the instrument round the stem, the horizontal incisions are commore, the indefatigable Editor of that invaluable vehicle, a fac simile, or drawing of full size, with ample references for its construction, will shortly appear.

the merits of the discovery may be submitted to the test of varied and multiplied trials, under your auspices, the approaching season; and with great deference offer some suggestions as an outline for

your government.

The first and most important point to be ascer-tained, is the period most suitable to obstruct the sap, in order to promote the highest state of improvement in the crop, and at the same time effectually guard against the rot.—For this purpose a number of rows in a cotton field should be appropriated expressly for experiments ;-commencing with one row when the flower buds appear on the first tier of branches-with the next when the petals of the flowers on those branches are first expanded; continuing to decorticate other rows successively at every marked stage of rowth, till the crop approaches to maturityleaving untouched, alternate plants in each row, as standards for comparison. There may possibly be periods when the bark will not peel freely; in that case the operation should be deferred till it can be easily and completely detached, so that no fibre be left to connect the circulation; nor should there be any shoots or branches permitted to remain between the roots and the excision, unless they are also decorticated.

Should you be disposed to extend the operation to acres or fields, the period I shall assume as most likely to produce the desired results is, when the plants are in full foliage, having the most part of the flower buds formed, that may be expected to come to maturity, and before the fecundating process has generally commenced; as the organs of fructification will be greatly invigorated, and,

of course, fewer abortive pods.

presents for the next enquiry; and on this point so much depends upon the luxuriance of the plant and the period when decorticated, that experience only can determine. It will be inexpedient to expose more of the Alburnum than necessary; and probably one-fourth of an inch may be as sumed as the medium, to prevent a union of the barks and a restoration of the circulation, before all the benefits from the process are realized.

I would further request, that your attention may be directed to plantations where no danger is apprehended from the rot, particularly to the black seed species, which, though not affected by that malady, except in peculiar situations or in consequence of long continuance of wet weather, is subject to a rust that destroys the foliage, causing the pods to shrink or perish; and also to a blight that shews itself in dark spots on the capsules; these, by what ever more correct names they may be distinguished, are both active members of the parasitic family—the effect of a diseased state of the vessels and not the cause. And probably may be repelled by the increased vigour imparted by decortication.

It should be kept in view that the black seed species is more disposed to produce wood than the green, especially on deep carbanaceous soils, such as ewamps and marshes; indeed so much so, as to become very unproductive from its exuberance and profusion of wood buds. There are strong reasons for concluding, that this disposition may be changed, and flower buds produced much more abundantly if the plants were decorticated at an early period, or as soon as there was sufficient stamina in the stalk to bear the opera-The necessary width of the excision of bark, tion. The prospect of an accelerated maturation

will, I trust, elicit attention to decorticate this species even on the sea islands.

As you may be unprovided with the instrument above described before the season for operating commences, one of the following description I presume may be conveniently within your reach. Insert into a haft the blades of two knives a quarter of an inch apart, or the width that may be necessary, having their edges parallel and even. With such an instrument two horizontal incisions are made at the same time; when the operator should divide the strip by one or two vertical cuts, and children might follow and detach the bark with their fingers. Although this method will require more than double the labour, and, without great care, less likely to be well performed than with a decorticator properly constructed, yet it is believed that considerable progress may be made in a day.

It remains to be stated that Letters Patent have this day been issued according to law, granting me the exclusive right to the improvement here announced. And I hereby give you a licease to make use of said improvement to any extent that may suit your pleasure or convenience, for and during the present season. At the close of which, namely, after the first day of November next, I shall be ready to receive overtures and to treat for the disposal of the right of said improvement, either for the State in which you

reside, for Districts, or to individuals.

With sentiments of high respect and consideration, I am, Sir,

Most faithfully your's, SAMUEL WYLLYS POMEROY. Of Brighton, Massachusetts.

different alphasial

THE DECORTICATOR.

Fig. 1, on each limb of which A. A. two knives of an elliptical form, B. B. are fastened by screws as better seen in fig. 2, for making the horizontal incision, set parallel and at such distance as the width of the excision may require; between each end in the centre is let in by a dovetail incisor C. figure 3, for making the vertical cuts having its edge at right angles and even with the edges of the horizontal knives. The operator grasps the stem with the instrument, and by a moderate pressure, which a spring between the these things, last season, took me into his garden handles enables him to regulate, the strip to be taken off is divided on each side, when by passing the instrument round the stem, the horizontal three components are completed, and by the same operations are completed. incisions are completed, and by the same operation the incisors detach the bark. Springs D. D. fig. 3. are attached at each end between the eliptical knives, and extending to the incisor. They give way on a slight pressure, and when that ceases, return to their former position and throw off the decorticated bark, which would otherwise accumulate between the knives, and obstruct their operation or consume time to keep them clear; the springs and incisors in fig. 3, are exhibited above the elliptical knife merely to give a more distinct view of each of them.

FROM THE NEW ENGLAND FARMER.

CULTIVATION OF VINES.

Mr. Fessenden.

SIR,-Perhaps there is nothing relating to our common gardening, in which people more generally err than in the manner of cultivating melons, be preferable. cucumbers, and other running vines. I allude to the practice of having too many plants grow in a hill. As far as my observation has extended, it appears to be the common practice to suffer as [As the turnip sowing season approaches, the folmany as from four to ten or twelve vines to grow in a hill. This, I believe, is an error. One good thrifty vine in a hill, I am satisfied is generally enough. I have been confirmed in this opinion, by seeing within a year or two, the effects of a the culture of this root. The county of Norfolk,

planted in hills eight feet distant, each way, and but one vine in a hill was suffered to grow. Both Coeymans. But our hard winters prevent our My experience with the Globe, a fields were well manured, and in good order; but using this root with English economy. There manner of their cultivation. In the first mentioned field the melons were of an ordinary size and quality, and the vines were much blighted. In the objection, I am satisfied, from four years's expetite objection, I am satisfied, from four years's expetite objection, I am satisfied they may be subjected by the other field where the blighted. In the other field where the blighted. In the other field where the blighted. In the other field where the blighted is a satisfactorily of their cultivation. In the first mention-before the frosts set in. Notwithstanding this objection, I am satisfied, from four years's expetitional distributions are wanted. the other field, where the hills were eight feet apart, the vines had no appearance of blight up on them, and the melons at that time, though they were not fully grown, were much the largest 1 ever saw. When they were gathered, as I have ever saw. When they were gathered, as I have since been informed, one of them weighed above forty pounds, and several between the largest I are varieties, is raised with very little trouble, and with me have been invariably a second crop. forty pounds, and several between thirty and forty pounds each.*

I seldom succeed in raising good melons, owing as I have supposed to the unsuitableness of the rate of one pound of seed to the acre-generally name ought to be given; for black or white, bond soil, it being of a wet, cold nature which causes hoed them once; and the medium crop has been them to blight. In consequence of this difficulty about 200 bushels per acre. The later turnips them to blight. In consequence of this difficulty about 200 bushels per acre. The later turnips in bringing them to perfection, I have frequently are grown the better they are for the table. wholly omitted planting them, although they are

* These were the melons noticed in the New England Farmer, vol. i. page 63, and cultivated by Mr. Were.

duced to plant a few similar to those I saw in Sa- about six rows being dunged at a time. The blew the vines in every direction, yet my melons

The advantage to be derived from having vines grow single, is I believe nearly as great, respecting the cultivation of cucumbers as of melons.

A neighbour of mine, who is very curious in one vine grow in a hill, in a part two, and in the cucumbers very fair, and he assured me that he had gathered from them as many, as from the same number of hills that had three or more vines in a hill. That part containing two vines in a hill was visibly different, they appeared less luxuriant than those of but one; and in that part containing three or more vines in a hill, they were

part is a great distance for water-melon vines to grow and singly too; but when it is considered that a single vine, in a rich soil, will extend over a rod or even more of ground, I think it must appear rational that in a rich soil it is not too great a distance. Doubtless in a light sandy or gravel-ly soil, lightly manured, half that distance may P R.

Franklin, April 23, 1824.

lowing will command attention.]

ON THE CULTURE OF TURNIPS.

Sands and sand loams are peculiarly adapted to Solem, who had two considerable water-melon fields. One of them was cultivated the usual way, that is in hills about three and a half feet distant, and with several vines in a hill. The other was planted in hills eight feet distant, each way and to the pine of the most improved agricultural districts in England, has acquired its high reputation, in a measure, by its turnip crops. Cattle are winter fattened upon them invariably, with the aid of straw, or sometimes a little hay. The soil of that county was very similar, originally but one of the most improved agricultural districts in England, has acquired its high reputation, in a measure, by its turnip crops. Cattle are winter fattened upon them invariably, with the aid of straw, or sometimes a little hay. The they are left in the field, and drawn daily as they rience, that they may be cultivated by us with great profit, as a cattle food, particularly the Swedish sort, or ruta baga

The flat turnip of which the green and red top

to me a real luxury. But the last season I was in-and better compensates for it. I plough twice mine should have had the benefit of such a sight (whatever fanatics may say, or write against rathrown into three feet ridges, by turning two fur rows back to back.—The manure is then drawn most of our "Seminaries of Learning," (so called out, and thrown with a shovel into the furrows, as they say in New England)

lem. My water-melon hills I had about eight feet manure is covered, by reversing the ridges, as apart; my musk-melons four, and I suffered but soon as practicable; and when the whole field one vine to grow in a hill. Notwithstanding the is finished, a light one horse roller is passed season was very unfavorable, having frequent over lengthwise, which flattens the ridges and sudden showers, accompanied with wind, which blew the vines in every direction, yet my melons ately dibbled in one foot apart. A man will make were very good, some of them the best I ever raised. The holes, and 2 boys of ten or twelve years old, will drop the seed, and cover two acres a day. One to four seeds are put into each hole. I prefer the dibble to the drill, on account of the greater facility of cleaning the crop, and because skim hoe is far preferable to the common hoe. another part three or more vines in a hill. At If the ground is not very foul, they are as easily that time, where there was but one in a hill, the hoed as an equal quantity of Indian corn. As vines were very flourishing, all the leaves green, soon as the roots are as large as a goose quill, I soon as the roots are as large as a goose quill, I thin them so as to leave but one plant in a place, and fill up vacancies by transplanting. After this the cultivator is passed through them once or twice, and the weeds, if any, on the ridges, taken out, with the hoe or the hand. The product has been from 400 to 600 bushels. To preserve the roots, dig about one foot deep upon the side of a apparently on the decline, the leaves had mostly bill, leaving the bottom inclining, and sufficiently become yellow and some of them black.

Perhaps it may be thought that eight feet a in the form of a cone, 100 bushels. Place the roots in it, and bring the top to a point as far as practicable. Cover with straw, and then dirt. They will bear considerable frost without injury. Take care to dig a trench round the mound to turn off the water. In March, or perhaps February, you may break though the frost and take out the roots, lay them on your barn floors, and cover them with hay or straw: from whence they may be fed to cattle.

The ruta baga is fed without cutting, to neat cattle; a bushel a day, with straw is enough for a milch cow. To fat cattle they may be given in greater quantity, though never so many as to occasion continual looseness. Hogs will feed and fatten on-them; cut small, they are remarkably fitted to fatten sheep; and the horse once accustomed to them, will prefer them to his grain. For all animals, they are improved by steaming or boiling. In the north they are improved by steaming or boiling. In the north of England, it has been stated, that stage horses are kept upon steamed ruta baga, without grain. A gentleman in Dutchess, wintered more than fifty hogs upon them

My experience with the Globe, and Scotch yellow turnips, is not sufficient to enable me to speak satisfactorily of their culture; but I have J. BUEL.

of the Albany Co. Agricultural Society.

TO THE EDITOR OF THE AMERICAN FARMER.

Washington City, May 4, 1824.

MR. SKINNER,

Enclosed you have an account of a most inter-sting race. The presence of mind and courage, manure, with uniform success. I have sown from the 20 July to the 10th August, broadcast, at the and skill, exhibited by the rider of Aratus, (whose or free, he deserves to be known) and the emulation and sagacity of the noble horse, worthy of his name and race, afforded the best of lessons teaching by example; and I had rather a son of mine should have had the benefit of such a sight

The sweepstakes won by Mr. W. R. Johnson's colt Revenge, by Sir Archy, was for 3 year old colts and fillies, \$200 each, mile heats, five subscribers, two of whom paid forfeit.

This colt is No. 40, of the "stud of a gentleman of the south of Virginia." published in Farmer of the 9th of last mouth, and is by his pro-

prietor called Young Janus, from his having, it is believed, more of the blood of Old Janus in his veins than any other horse now living.

ed the wrong way, and before he could be got off, requires considerable exertion and perseverance, the fillies were from 150 to 200 yards ahead (equal to rouse our farmers to a proper spirit of imto three distances.) This heat was won by Mr. provement. I must in justice to our legislators ly, and the Director filly was distanced. Your constant reader,

PHILIP.

the spectators wonderfully gratified.

is known to abound.

of

deman of the south of Virginia.

It is expected that Mr. Olmstead will shortly make public his experiments and scientific results on this subject.—Raleigh Register.

I remark that you have, in the American Farmer, lately asked for some fine melon seed; I send mer, lately asked for some fine melon seed; I send sults on this subject .- Raleigh Register.

Editorial Correspondence.

Extract from a Pennsylvania correspondent \\
Dated 1st May, 1824.

Mr. Wynne's filly by Sir Archy, out of a very fine Jack Andrews mare, and Mr. Harrison's filly by Director, staked against him. He won the first heat easily; at the start for the second heat he turn-heat easily; at the start for the second heat he turn-heat easily at the start for the second heat Wynne's filly. The third was taken by the colt; say that they have uniformly discovered much li-he could easily have distanced the Sir Archy fil-ly, and the Director filly was distanced.

This co berality and good sense, by their dispositions to promote the agricultural interest. I am sorry to These ar say I cannot step over the line, and bestow the same just meed of praise on Maryland. I was THE RACES AT LAWRENCEVILLE
TERMINATED LAST FRIDAY.
The sweepstakes for 3 year old colts, was won by Wm. R. Johnson's colt Revenge*, by Sir Ar chy, at three heats.
The Proprietor's Purse, by Mr. HARRISON's with the suggestion of Mr. Reed, of Washington, H. Arab, at one heat, in great style.

The Jockey Club, by Mr. HARRISON'S Horse Aratus, by Director. This Race was one of great interest from an unusual occurrence, for the last heat was run by Aratus without the support of a harvest, the maturity of particular vegetables; bridle, one rein having broken immediately after also the arrival and departure of swallows, mar-starting. The admiration immediately felt for tins, &c. &c. What a treat it would be to look him the first heat, from his elegant appearance into a table of this kind, made one or two hundred nim the first heat, from his elegant appearance into a table of this kind, made one or two hundred under motion, was wound up to a pitch of enthusiasm, when he was discovered keeping the lead is sisted and perfect steadiness, under the immense disadvantage of deriving no support from his rider; and when the rider too was seen to his rider; and when the rider too was seen to stead of measuring. By this method we obviate the lift which by pulling a difficulty that cannot well be got over on the his rider; and when the rider too was seen to be be be did not an adjust the bit, which by pulling a difficulty that cannot well be got over on the at one rein he had drawn entirely through his measuring plan, without great trouble, I mean mouth, and then grasp the mane for his own support. He came through ahead with much controlled the came through ahead with much controlled the cannot be measured without disvenience, beating Mr. Johnson's horse Defiance, and distancing Mr. Drummond's mare Lady Ran titudes. The mode I would propose, is to have the label by Six Archy. The course was in good or a square funnel exactly one foot wide at the dolph by Sir Archy. The course was in good or a square funnel exactly one foot wide at the der, the weather good, the attendance good, and mouth. Let this funnel be inserted into a reservoir, entirely close, except when the funnel is introduced. To prevent waste by evaporation, it should be protected from the rays of the sun. It Interesting Discovery.—Professor Olmstead of should also be fixed in such a manner as to be conthe University of North Carolina, has ascertained that a fine illuminating gas may be obtained thou of finding the depth of rain that has fallen, from cotton seed. The product of gas from a is a matter of plain calculation. We know that a bushel of seed, is more than double the average cubic foot of water weighs 62½ pounds. When product of the same quantity of Newcastle coal, we find that this weight of water has got into the and greatly exceeds that in illuminating power. reservoir, in a given time, it shows that 12 inches It partakes of the purity and splendour of gas of rain has fallen during this time. If we find 100 from oil, with which substance, indeed, this seed pounds of water, it will show that one foot seven known to abound.

The experiments already made induce the If we find 5 lb. 3 1-3 oz. it will show that previbelief, that, among all substances hitherto tried ously one inch of rain has fallen; this being the for gas illumination, this article will be found the twelfth part of 621. I have never heard of any most eligible, especially for our southern cities, trial being made of this mode; but I am disposed where cotton seed can be obtained at a very tri-ling expense; and the idea suggested that this nothing wanting but the funnel and reservoir, this article may possibly become of considerable value for exportation. The vast quantity of seed, tioned it to some gentlemen whom I consider amounting to many millions of pounds, that annuqualified to judge, they consider it (for our cli. Boil together for a quarter of an hour, an abile almost useless and sometimes noxious, would, The most convenient of all modes for a warm cliounce of dried marsh-mallow root with half an ounce of dried marsh-mallow root with half an ounce of dried marsh-mallow root with half an ounce of camomile flowers in a pint of water; the most convenient of all modes for a warm cliounce of camomile flowers in a pint of water; the most convenient of all modes for a warm cliounce of camomile flowers in a pint of water; t is thought, afford materials for illuminating al mate, is a float to be raised by the water in the strain through a cloth. The fomenting flannels reservoir, to which is attached a scale, passing should be sprinkled with spirits, just before they up through the funnel, and marked in such a are applied to the inflamed part. * Mr. Randolph's Young Janus by Sir Archy, manner as to show by its ascent, the cubic inches put of Frenzy. These are of a remarkably fine kind I got some ears ago, direct from Spain, by the hands of a riend. I have cultivated them several years, and found them continue alawys alike, and always delicious. As they came to me in the time of the cortes of Spain, I christened them cortes melon.*

Mattawoman House, April 10, 1824.

DEAR SIR,

"If you have any seed of the Bene Plant to spare, they will be thankfully received.—and in return, I herewith enclose you a part of a small portion of watermelon seed, sent me by a friend from the Mediterranean, and which he represents to be uncommonly fine."

Your's, &c. WILLIAM S. MASON.

Taylorsville, May 5th, 1824.

I send you three kinds of melon seed; the overton is a long green rind, red pulp, and very fine; the goodall is a white rind, red pulp, and grows very large; the other is a kind that I found in an old writing desk I purchased at auction in Richmond, which is thought by some to be very good, but I cannot say I like them, we have what is called the ice rind, and the melon of the green. The melon of the green is a large round melon, yellow pulp, green rind, and light coloured seed; they are a fine melon late in the fall, I think I can get you some of the seed. WM. D. TAYLOR.

20-RECIPES IN MEDICINE.

To diminish Inordinate Inflammation. Mix 1 drachm of Goulard's extract of lead, or solution of sugar of lead in water, with 4 ounces of rectified spirit, and 6 ounces of distilled water. Make a lotion which is to be applied to those surfaces where inflammation is very rapid.

Another Method.

Dissolve two drachms of sulphate of zinc (white vitriol) in a pint of distilled water. To be applied as above.

[.] I had of this kind no seed of greater age, or would have sent them.

To make strong, or Book-Binder's Paste. Mix wheaten flour, first in cold water, then up, in that body, on Monday next. The fate of boil it till it be of a glutinous consistence; this each of them, as well as of the bill itself, is yet method makes common paste. When you wish it to be of a stronger nature, mix a fourth fifth, or sixth of the weight of the flour of powdered alum: and where it is wanted of a still more tenacious quality, add a little powdered rosin.

Excellent Cement for Broken China, May be made from a mixture of equal parts of glue, white of egg, and white lead.

To prevent Gentlemen's Hats from being spot-ted after a Shower of Rain.

If your hat is wet from rain, or any other cause shake it out as much as possible; then with a clean linen cloth or handkerchief wipe the hat very carefully as well as you can, observing, that in so doing you keep the beaver flat and smooth, in so doing you keep the beaver flat and smooth, sending things in this way, which our friends may in the same direction as it was first placed, then with your hands fix it in the original shape, and hang it at a distance from the fire to dry. A few hours after, or the next morning, lay the hat on the table, and brush it round and round several times with a soft brush in the proper direction, by R. Caton, Esq. for distribution in Maryland. and you will find your hat not in the least injured by the rain.

If the gloss is not quite so high as you wish, PRICES OF COUNTRY PRODUCE-carefultake a flat iron, moderately heated, and pass the same two or three times gently over the hat; brush it afterwards, and it will be nearly as handsome as when first sent home from the shop.

To perfume Linen.

Rose leaves dried in the shade, cloves beat to a powder, and mace scraped; mix them together, and put the composition into little bags.

Beef Tea.

Take lean beef, a pound, cut it in thin slices, put it into a quart of water, boil it a quarter of an hour; then take out the meat, mince it small, and boil it a quarter of an hour more, skimming it well.

To clean Flint-glass, Bottles, Decanters, Gc. Cc Roll up, in small pieces, some whited-brown or blotting-paper; then wet and soap the same; put them into the vessel, with a little luke-warm water; shake them well for a few minutes; then rinse the glass with clean water, and it will be as bright and clear as when new from the shops.

To prevent the mischief arising from the Bite of a Mad Dog.

Where the excision of the part bitten can be immediately performed, it is the best preventive of danger, or where the part can be burnt out by the application of a red hot iron, little danger is likely to happen. Nothing else is at all to be depended upon.

PAPERS

Read at the last meeting of the Agricultural Society of the Valley, and by order of said Society, communicated for publication in the Ame-

munication to farmers on the subject of their queries propounded by our secretary, and his two pints per acre, and harrowed in. Very is a practice prevailing with us, however coninvitation to a free exchange of information on late in the fall the largest were carted off, and genial with the best social feelings, is nevertheagricultural topicks; also in a sincere desire I the sheep had ample provision in the balance, less utterly at war with the prospect of reforprofess for the improvement of our husbandry through agricultural Associations. Under similar impressions I had been in the habit of sending to the American Farmer the result of my efforts to improve the breed of sheep, with a hope of exciting a more special attention to of flesh, but the circumstance of my long wool-still leave the best-the practice also of perthat part of our occupation, but the suggestion led sheep, being in their prime, and the me-of a member that any remarks made on the sub-ject might reach those useful pages through them for four or five years but by the long getting the best mutton they will also get maject might reach those useful pages through the medium of our society, determined me in the propriety of respectfully placing at your discretion the report of my last shearing, with a few observations thereon—perhaps in the infancy of our institution, and in the absence of learned or scientific communications, a plain practical relation of facts may be interesting, and enable you to turn them to some advantage. The substance of discussion in the Agricultural Journals of our country, especially as it bears a double relation to our wants and our comforts. It is from the same animal that we obtain the choicest and most wholesome supply of food for my determination to select the finest, closest my discussion in the reach those useful pages through them for four or five years but by the long getting the best mutton they will also get mature and opinion page through them for four or five years but by the long getting the best mutton they will also get mature and opinion page through them for four or five years but by the long getting the best mutton they will also get mature and particular th our tables, and the material for a great variety of clothing suited to a vast extent of climate. desired effect of uniting as nearly as possible wise, immediate; or relying on future advantually and quantity; the same practice will, tages accruing from a mass of practical information must then be an object of great concern of course, apply to other breeders of a simito both rich and poor; and if by a change in lar stock. management we can obtain more wool and meat from one half, or two thirds of the animals kept, our soil must consequently improve under an additional covering of grass, and we be immediately benefitted in the increased quantity of tallow, flesh, and wool. There is a beguiling propensity with most of us to crowd our lands with stock, preferring, as it would seem, numbers to quality, and forgetting the difficul-ties attending a dry climate and long winter. When in the habit of keeping double the num-ber of my present stock of sheep on the same ground, I was compelled at particular seasons to go to extraordinary expense in their feeding to keep them in a thriving condition. Notwithstanding, the average weight of their fleeces fell from eight to between four and five pounds. Experience then teaches me to keep no more sheep than I can feed well with economy, and have those separated in warm weather, never increasing their expense, risk, or trouble, by having lambs sooner than the first or middle of March, when they may have green food. A rye lot proportioned to the number of breeding ewes need be the only additional expense in keeping, to common pasture and good wheat straw when the snow is on the ground. A slight

food) should be given them once or twice a merino fleeces 6½ lbs.

week throughout the year, mixed in their salt.

With the aid of improvements through crosses of some of the officers and members of the on the second day. Food will be provided for and selection, I will venture to say our flocks Souch Stock offered for premium or Show as shall will double their produce in a short time. A and selection, I will venture to say our flocks Society. With regard to the expense of an individual flock, I may almost say that mine cost me nothing last winter. The weather, to be sure, was uncommonly favourable. A rye lot of nine acres divided, was their chief food, which was grazed until the 10th of April, and left pretty bare. I have hired the threshing of the rye, in order to ascertain the quantity in time for your information. Two hundred and twenty three bushels have been measured up, and I wool was unwashed, and freed only from the ety, communicated for fublication in the Ameliane on doubt there was two or three bushels gross tags. Samples of the above fleeces are left on the ground per acre, not having horse-raked it, as was the rest of my stubble (nearly twenty-five bushels per acre.) I had like to have forgotten a considerable part of the pro-nunication to farmers on the subject of their duction of this ground. Turnip seed was sowed washed wool. Does it not prove the necessity profession and prosperity, I might find it in the the last of August, with the rye, at the rate of of our endeavouring to do so likewise? There preferring turnips to rye. I had hoped at this mation—I mean that of selecting the very finest time to have been enabled to make a comparison between the productiveness of the long wool, and the merino; and to have ascertained time, or until our flocks are more uniform, how much good wool they sheared to the pound would enable us to have them very fine, and choicest and most wholesome supply of food for my determination to select the finest, closest not merely for individual benefit, whether in woolled males to breed from, will have the the expectation of rewards, honorary or other-

> at the rate of one pound to every ten and eleven pounds weight on the hoof. The Merino, Arlington long wool, and Tunis sheep are the most ment of our domestic animals, as essential to noted and valuable breeds immediately amongst the more comfortable existence of a very large us, and according to the situation and views of class of our farmers, whose situation, moderate the breeder, deserve the greatest attention, eisettlements, and most industrious lives, pre-ther to perfect them as a distinct stock, or by judicious intermixtures to produce such valua-through the intervention of superior wealth and ble varieties as their nature, controlled by our skill, is possibly susceptible of.

June 3d. Sheared 49 sheep—5 wethers, one only a two year old—2 rams, one and two years old—12 ewes first shear—30 ewes from two to five and six years—26 of which produced 36 lambs, and raised 30 of them.

intelligence. I would take the liberty of suggesting, whether the most useful and œconomical way of diffusing information on the subject of husbandry (together with that respectability which would be added to our institution) would not be in acquiring a small but well selected the paragraphs, in order to be able, at some stallibrary, for the use of the Society, and afford ges of the work, to refer, with the more facility, the Presses of Winchester an opportunity of a to parts that have gone before. The last number weekly supply of agricultural matter for the will contain an index, by the means of which the wholly by the sweat of their brow; and, is it not benefit of their subscribers; is it not reasonable several matters may be turned to without loss of degrading to human nature, that all the nine to suppose that a work of such apparent useful-time; for, when Economy is the subject, time is tenths should be called poor; and, what is still ness would have the effect of rewarding them a thing, which ought by no means to be overthrough an increase of patronage for any trou looked. ble they might meet with in assisting the 2. The word Economy, like a great many oth cause? The materials for the speedy amelioraers, has, in its application, been very much abuse a state may be such as to render it impossible

both by breeding in and in, and by crosses on our home stock, some of the best stock in Europe.

Out of the numerous kinds of sheep in Great Britain, which they appear to have nicely discriminated and allotted to their various soils and situations, we have selected the Leicester or Dishley (alias celebrated Bakewell sheep) and South Down, which are to be had in admirable quality in Jersey and Delaware, and are by far quality in Jersey and Delaware, and are by far the most valuable sheep for all those who do lity and character of that geople: and the ability ing of his family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in a manner that must eight in the family in the f the most valuable sheep for all those who do lity and character of that people; and the ability ing of his family in a manner that must give him not intend raising wool on a large scale for the manufacturer—the latter of these breeds may be measure, upon the economy of the several fami-short close woolled ram on well modelled ewes. I know not whether they have the full blooded nation permanently great, consisting for the Teeswater to the Eastward, the heaviest breed greater part, of wretched and miserable fami-food and goodness of their attire. The old sayof sheep in England; it would be well for us to lies. possess so large a race—but I am of opinion we are mainly deficient only in the form of the ani is desirable, that the families of which a nation dation in nothing. And, in spite of all the remail, which enables them to carry much more consists, should be happily off; and as this definements of sickly minds, it is abundant living mal, which enables them to carry much more flesh and fat with a greater economy of keep. Pends, in a great degree, upon the management of suchly minds, it is abundant living flesh and fat with a greater economy of keep. Pends, in a great degree, upon the management of their concerns, the present work is intended to form one, as when viewed by me some years form now, as when viewed by me some years past in the state of New Jersey. The form of these sheep must strike the eye of every behold er, and will, I hope, make an impression of the great others, or to persuade themselved, and they can be happy in a state of want sheep of great apparent size, a considerable of the necessaries of life. The doctrines which fanaticism preaches, and which teach men to be may cut a conspicuous figure—but in real value take a flock throughout the short legged, long tendency, and are calculated to favour tyrants bodied, straight backed, &c. &c. carrying a by giving them passive slaves. To live well, to constantly uses his to be shown the great skill of the shepherd, empty in the purposes of the empty to hunger, thirst, and perish with its the lambnes of work is intended the finements of sickly minds, it is abundant living amongst the people at large, which is the great finements of good government, and the surest basis for the lubouring classes of good government, and the surest basis of the lubouring classes of national greatness and security.

A Committee consisting of John A. Aiken,

B. Lundy was appointed to deliver an Oration

at the next stated meeting.

The following persons were elected honorary members, viz :- Hon. Thomas Emmerson, Dr. Thomas G. Watkins, Hon. Samuel Powell, Gen. Andrew Jackson, Robert Dixon, Esq. Col. Edward Ward, and Col. John Williams.

DEAR SIR.

WM. DICKSON, Chairman.

THOMAS HODGE, Jun. Secretary.

Baltimore College, May 17th, 1824. TO THE EDITOR OF THE AMERICAN FARMER.

I have devoted a few leisure-moments to the make such by-laws and regulations, as they examination of the plants of which you have

The plant which goes under the name of Guinea Art. 14. Every member, on joining this so- Grass, is the Panicum laeve, mentioned in the ciety, (honorary members excepted) shall pay to botanical part of the French Encyclopedia, by nentioned in the eighth article.

Art. 16. The Society shall consist of inhabisigned to other gramineous plants. This has

inquire, in this place, into the propriety of this Art. 18. This Constitution or any article there-removal from the original class Polygamia to the confine myself to observing that the H. spicatus The foregoing articles were separately read and is a native of Asia and Africa, where it has been adopted. After which the Society went into an improved by culture, and whence it has been transferred into Europe aud America. Its seeds are extremely farinaceous, and the meal or flour obtained from them considerably swells in water; and a quantity of it so small as to be easily contained in the hollow of a man's hand, will afford him abundant nourishment for a whole day. Hence it proves highly serviceable to the negroes, and is chiefly used by those of Senegal, when travelling. It may, perhaps, be no idle suggestion to recommend this viaticum to such among us as may be destined to distant expeditions through wild and barren tracts of country. Previous trials may readily be made to test this property of the H. spicatus.

The plant seen in Alabama by one of your esteemed correspondents, and afterwards successfully cultivated by himself, is, (so far as I can judge from the specimen sent to you) the Pani-cum italicum, which, according to Elliott, grows from 2 to 10 feet in South Carolina and Georgia. This plant is an exotic, which early passed from

India to Italy, whence it has derived its specific deserve the attention of every enlightened agri- 1792. Gr. m. Calypso, full sister to the famous name, and reached the new world.

correspondents to the following remarks.

Whether the method adopted and pursued by a botanist, be artificial or natural, its object eviproblem.

Botanists ?"

This problem once solved, that is, the name and rank of the given production clearly known, we in a few hours what much time and personal observation could hardly have taught us.

The methods which I pursue (for I sometimes use the Linnean system, sometimes the arrange-ment of Jossicu, and at other times the analytic pecially, of the parts of the fructification, that is, of the flower and fruit. These parts are essentially necessary for the determination of the class, order, and genus; the species requires to be determined circumstances of a more variable nature, and embracing a wider compass. The upper, lower, and even the radical leaves; the stem, the root, in short, the whole plant should Of Col. When science is carried into the commonest burned. and most humble concerns of life, it is then the most useful, honourable and amiable; for it benefits those who need the assistance which they cannot procure for themselves .- Sir Humphrey won ten battles, and sacked a dozen cities. Now ny me to my fowl yard, and detect by dissection, cellent for fowls of every description.

COUSIN TABITHA. the disease which is so destructive to the poultry of all housewives—I do not say he should be placed by the side of Davy and Jenner, but I do say he should be placed by the side of a nice chicken pie every week. The gapes in chickens is said to be a worm, and some say a collection of worms, in the wind pipe. Whatever may be the nature of the disease, it usually destroys a large proportion of all the chickens that are hatched. I have opened the wind pipes of several that have died of this disabled you certha public with his garantees of several that have died of this disabled you certha public with his garantees. chickens that are hatched. I have opened the in ploughing, that he would not again have trouwind pipes of several that have died of this dis-bled you, or the public, with his superfluous comease, and have usually drawn from them a worm like substance, a little larger and shorter than a common pin. It seems at first view endowed with life, for it contracts on being touched—but I of the agricultural community award the prenow believe it composed of a thick viscous matter, that is secreted in consequence of inflammation, and lines the wind pipe. I have not examined the apparent worm by a microscope, which I do not possess; nor have I tested its substance by chymical processes which I do not understand, but the difficult respirations, the suffused state of the vessels of the throat, and this filmy worm found lining its canal—all led me to suppose the disease to be inflammatory, and similar in its nature to that, which, under the names of croup, and quinsey, prove so fatal to children. Two circumstances have led me to a remedy. Last year one gang of my young turkeys had access inflammatory inflammatory and suppose the society of Friends, who are very will ensure to us a preponderance of national many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations your kindness has laid me under, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations in the sunder, that I must not forget my promise, to inform you of the result of the last meeting of our many other obligations in the sunder, that I must not forget my our of the result of the last meeting of our many other obligations in the last meeting of our many other obligations.

It is now decided to open the institution on the brief of February, 1825

C. In 1799 and 1800, he beat the best ly in an apple nursery, which they devoured ence here; his exertions to introduce his plough, horses of the day with great ease; was greedily, and were all raised; while, at the same have been unwearied and incessant—and most of considered the best horse that ever time, another brood confined on the short blue the Friends have encouraged him, and some of ran in Virginia, and is yet quoted as grass of the house lot, nearly all died. Again—their first racers.

UNIVERSITY OF VIRGINIA, ITS PROGRESS AND PROSPECTS.

Bremo, May 3d, 1824.

DEAR SIR,
The Cherokee Rose cuttings have this moment come to hand, and remind me, among the

tant establishment.

I trust, that all the worthies who have so successfully co-operated in the establishment of an institution to promote the intellectual and moral improvement of the Ancient Dominion, will now cordially unite their efforts to carry into execution the canal along the Valley of James and Jackson's Rivers, so eminently calculated to develope her physical resources. This done, we may expect procured by each. to maintain our relative standing with our sisters of the Union.

Accept my thanks for the intelligence you have occasionally sent me in relation to the Delaware and Chesapeake Canal.

Your's with high regard, JOHN H. COCKE.

To J. S. SKINNER.

BALTIMORE, FRIDAY, MAY 21, 1824.

Extract from the minutes of Proceedings of the Board of Trustees of the Maryland Agricultural Society.

May 12th, 1824. Agreeably to adjournment, the Board of Trus-Agreeably to adjournment, the Board of Trustees met at Green Spring Punch, the residence of S. Owings, Esq.—Present, Gen. C. Ridgely, of Hampton, Chairman—S. Owings—Jacob Hollingsworth—D. Williamson, Jr.—R. Caton—Christopher Carnan—H. V. Somerville—N. M. Bosley—James Gittings, and N. W. Hall, Esqs., Bosley—James Gittings, and N. W. Hall, Esqs., and will doubtless receive the sanction of gress, and will doubtless receive the sanction of the President—We shall publish the law as one The committee appointed at the last meeting to the truth of the various and very opposite opin-

character in the faculty of this great and impor- procure a seal for the Society, and a certificate ions as to its practical bearing on the welfare of of membership, report that that duty has been executed, and that the certificates have been printed and delivered to the Treasurer, and want only the signatures of the President and Secreta ry; whereupon the committee recommend that lately erected by some of our most enterprising the Treasurer procure said certificates, to be so and worthy citizens, was on fire and no hope is signed and then delivered to the trustees and others, according to the number of subscribers

On motion by David Williamson, Jr. Resolved, that a committee be appointed to procure the plate for distribution at the next Cattle Show, according to the scheme of premiums published in the American Farmer, page 10 of vol. 6—and James Cox, B. W. Hall, H. V. Somerville, and J. S Skinner, were appointed to contract for said plate.

On motion by R. Caton, Esq. it was Resolved, that it is expedient to encourage the growth of cotton in Maryland; and that, as accessary to Being a copy of one in use by an Illustrious Phi that object, a premium be offered of thirty dol losopher and cultivator of literature and the lars in value to the person who shall first, before heaceful arts, not far from Charlottesville in the month of November in the year 1826, erect a Gin, and by it, clean in one year, one thousand pounds of Cotton.

On motion by H. V. Somerville, Esq. Resolved, that a committee of five be appointed to prepare a list of judges, to award the premiums which have been offered for distribution at the next Cattle Show on the Western Shore of Maryland, and that said list be submitted to the Trustees, at their next meeting, to be then finally decided Frame-Peas, Sow all these, and they on.—J. Hollingsworth, H. V. Somerville, J. S. Hotsfurs, Swill come in succession Skinner, D. Williamson, Jr. and B. W. Hall, Ledman's, of a fortnight's interval. were then appointed a committee to prepare said

April 1. Ledman's Peas, Snaps, Capsicums, Board of Trustees, within three days Salsifis, Long Haricots, Lima Beans, meeting, to be published in his journal.

On motion by the Chairman, it was Resolved,

meeting at Long Green, the residence of James Gittings, Esq., on Wednesday the 9th of June.

TO CORRESPONDENTS.—"JAMES" was received too late for this paper—all the matter is given out on the Saturday preceding, except a column or so, for Editorial scraps.—Several original and valuable communications will appear in our next .- We must close the publications of Anne Arundel County made upon old land, sold the papers from the Agricultural Society of the Valley, before we commence those from the Washington Agricultural Society of East TEN-NESSEE.

We need not repeat the melancholy particulars of the bursting of the Steam boat Etna's boilers, by which many lives were lost-our readers have doubtless seen the details in other pa-

Congress will rise on the 27th of this

members.—James Howard, the Secretary being the President.—We shall publish the law as one absent, J. S. Skinner acted as Secretary protem. of great moment to our patrons.—Time will test

society.

When this paper went to press (Thursday evening) the interior of the elegant Shor-Tower entertained of extinguishing it. It had we believe answered the expectation of its founders, by rendering us independent on other cities for a supply of that article.

THE RACES .- The first days purse of \$400. was taken by Gen. Wynn, of Virginia, nothing appearing to compete with his bay filly "Flirtil--she galloped round the course

The second day's purse of \$300 was run for yesterday by General Wynn's filly Platina, and Mr. Wilson's horse "Greyhound"—Platina won the two first heats, and of course the purse easily.

ERROR CORRECTED .- In Number 7 of the Farmer, page 51, No. 68, Sir Archy, for "run as a colt successfully at Washington, having the distemper, &c," read "run unsuccessfully."

PRICES OF COUNTRY PRODUCE—carefuly collected every Thursday, for the American Farmer. By ROGERS & STMINGTON.

Flour, Howard-street, \$6—Do. Susquehannah, \$5 62½ to \$5 75—Do. Wharf, \$5 75—Do. Rye, \$2 25 to \$3—Corn Meal, pr. bbl: \$2—Wheat, white, \$1 25 to 1 27—Do. Red, \$1 20 to \$1 22 Potatoes, early—plant.

15. Nasturtium, Tomatos, Carrots, Beets, Garlic, Leeks, Onions, Chives, Shalots, Scallions, and forward Turnips—sow, Editor of the American Farmer with an official Cts.—B. E. Peas, 56 cts.—White Beans, \$1—Scallions, and forward Turnips—sow, Editor of the American Farmer with an official Cts.—B. E. Peas, 56 cts.—White Beans, \$1—Scallions, and forward Turnips—sow, Editor of the American Farmer with an official Cts.—B. E. Peas, 56 cts.—White Beans, \$1—Scallions, and forward Turnips—sow, Editor of the American Farmer with an official Cts.—B. E. Peas, 56 cts.—Apple Brandy, 40 cts—Peach Editor of the American Farmer with an official constraint of the proceedings of each meeting of the Board of Trustees, within three days after such meeting, to be published in his journal.

On motion by the Chairman, it was Resolved, that it be the duty of the Secretary to forward a 75-Do. Untrimmed, \$5 75-Ginseng, 30 cts.-Gerkins, Melons, Eggplant, Okra, written notice to each member of this Board, at least four days previous to each meeting—to appropriate him of the day and place fixed for said of Lettuce should be sowed every Monday at 11 o'clock, A. M.

The Board they are discussed to held the formal of the secretary to forward a 13-Do. Chilimmed, \$5.75—Ginseng, 30 cts.—

Linseed Oil, 62 cts. in demand—Clover Seed, \$3.75 per bush—Flax Seed, rough, 75 to to \$3.75 per bush—Flax Seed, rough, 75 cts.—Timothy, Do. \$2.50—Hay, per ton, \$10—Seed, \$3.75—Ginseng, 30 cts.—

even the dead to life. Should the farmer, how-experiments during a limited experience at farm-ever, succeed in setting a handsome sod of clovering. The predominant ingredients of gypsum, with the cheerfulness of success he bestows on the ON THE USE OF GYPSUM.

DEAR SIR,

Having frequently noticed many injurious ef
black black and immediately and by begins, even in the infancy of the plant, to derive (as he conceives) some advantages from them to the earliest state of putrefaction. That his agricultural wisdom, and the peculiar conplaster of paris possesses this attribute in the most Having frequently noticed many injurious effects resulting from an improper use of gypsum or plaster of paris, throughout the United States, I am induced to offer a few hints to the publick, on this subject, through the channel of your truly excellent and useful paper, with the view to impress the idea, that while plaster of paris is admitted to be an invaluable manure, yet the manifest of the project of the same effects to be produced in the other, and often in yery dry weather the plaster of paris possesses this attribute in the most stitution of his soil. So soon as the grain is reminent degree, is exemplified by raising two moved from the harvest field, his hogs are turned mounds of partially rotted manure, and by disseminating the plaster in repeated sprinklings through the one, and raising the other exclusively of manure, it will be found that the plastered mound will heat and throw out smoke in half the time necessary well set will at this time predominate in the most of paris possesses this attribute in the most eminent degree, is exemplified by raising two moved from the harvest field, his hogs are turned mounds of partially rotted manure, and by disseminating the plaster in repeated sprinklings through the one, and raising the other exclusively of manure, it will be found that the plastered mound will heat abour, will prefer to feed on that crop which is and throw out smoke in half the time necessary well set will at this time predominate in the most of the mounds of partially rotted manure, and by disseminating the plaster in repeated sprinklings through the one, and raising the other exclusively of manure, it will be found that the plastered mound will heat and throw out smoke in half the time necessary of the partial partia ner of using it, now in general practice, is most injurious and destructive to our lands.

A system of husbandry producing a continual deterioration of the soil, is no less disgusting to the farmer, than ruinous to the owner; for in a the clover is a plant no less delicate in infancy, the clover is a plant no less delicate in infancy, the owner; for in the clover is a plant no less delicate in infancy, the owner; for in the clover is a plant no less delicate in infancy, the colinary quantity of a bushelt of the sone. few years it cuts off the sources of his support and than vigorous in maturity. The succeeding spring tillage might have been productive and abundant, closed for the scythe, and even an abundant crop into the very emblem of poverty and desolation. It is now about twenty years since the American of the farmer, who still excludes every hoof ungrowth on the plastered part will be thoroughly farmer became acquainted with the application of til the field produces another crop is mid-the ordinary quantity of a bushel to the acre, and in the spring ensuing, if the same land be closed for the scythe, and even an abundant crop again ploughed at the same depth so that the vegetable matter be exposed, it will appear that the later became acquainted with the application of til the field produces another crop is mid-the ordinary quantity of a bushel to the acre, and in the spring ensuing, if the same land be closed for the scythe, and even an abundant crop again ploughed at the same depth so that the vegetable matter be exposed, it will appear that the farmer became acquainted with the application of til the field produces another crop in mid-sum- rotted, and in the finest condition for benefitting plaster of paris to the uses of husbandry, and I mer, which is again cut for the purpose of seed am inclined to believe that the agricultural inter- or salted hay; and to put the finishing stroke of am inclined to believe that the agricultural interor salted hay; and to put the finishing stroke of
still be very harsh and comparatively in an unest of the United States has been little benefitted,
if not seriously injured by the introduction of it.
But to attribute any thing like evil to this truly
bare, droves of hogs pawing and tearing up the
valuable manure, almost implies a contradiction very root of the clover, which to do the farmer
in term, or a solecism in language; so long and so
justice, he did intend to bestow as a legacy on the
intimately has it been associated with the imland; like the miser who bequeathes his gold
provement of land. It is true, the use of plaster
because he cannot take it with him. The plan of
paris in itself contains no vegetable nourish ment,
the paris in precise of plants by convert on our lands generally, has increased our crops operation for the ensuing year is equally destruc both of grain and grass, for many years past; but tive, and continues until the field is again put turning nothing to the land for its amelioration or return it receives for this extraordinary production little or no return to them, in a few years the improvement, his farm is soon destined to certain, is a partial shade during the summer, and whole put rescible matter of the earth becomes ruin, and he not unfrequently reminds me of the the few remaining clover roots that are ploughed exhausted, and then it is that plaster of paris in the start who destroyed the receives for this extraordinary production. ruin, and he not unfrequently reminds me of the simpleton in the story who destroyed the goose to obtain her golden eggs the speedier. I consider it sir, an unalterable principle in good farming, had lall lands judiciously tilled will acquire additional fertility, while they continue to yield larger and finer crops; and wherever we find an increase of crop attended by a decrease of soil, we may readily conclude that the system of cultivation is erroneous, and must, if continued, terminate in the lands of the land. We should saw our lands with have afforded with a making the first meaning clover roots that are ploughed in, when the scene is closed by the flushing of the land in, when the scene is closed by the flushing of the flushing of the flushing of the farmer becomes in a quadruple ratio at the farmer becomes words, by an improper recourse to plaster, our lands are more speedily impoverished; for nerosity, and the latter (when he can borrow no longer) strikes off his arrears by an act of arbitrary power; and if I may use the expression, retroneous, and must, if continued, terminate in the leves himself of the debt under an agricultural into immediate action, and the soil left desayour. ruin of the land. We should sow our lands with bankrupt law. That this most detestable custom by that system of husbandry which I endeavour plaster, with the desire permanently to enrich is practised to a great extent, if not in the whole, to deprecate. Any farmer who will impartially them; but the farmer is too generally deluded by I presume the most unqualified apologist will not try the experiment, may remark that the first the hope of an immediate return in an increase deny; and although the language may be rather application of plaster to his lands will always be of crop, and he gathers, apparently without reharsh for the delicate organs of modern husband-the most efficient, and its effects by repetition gard to the injury inflicted on his lands, much less men, yet the animadversion is not too severe for will rapidly decline, unless sufficient vegetable gard to the injury inflicted on his lands, much less with a view to their ultimate improvement. It is well known that the greater portion of the lands in Maryland are made to grow luxuriant crops of clover or other fertilizing grasses, with the aid of plaster, and it is through this secondary influence class of earthly scourgers who disgrace the that the judicious farmer is enabled to enrich his lands; but the abuse of the best blessings in life may convert them into evils, and with a pathetic indifference to future consequences, as well as a total disregard to the great benefits which might to forget the future in the first instance an immediate fertilizer of the soil. But I have heard many farmers declare, with the confidence of error, (whose practice was to take all and leave nothing) that their lands had tired of plaster; and well they missed the first instance an immediate fertilizer of the soil. But I have heard many farmers declare, with the confidence of error, (whose pract

the speed with which it permanently enriches the correct, that these lands of low or even surface have acre as he would otherwise receive from several. that practice of cultivation by which the land is made to produce more than its natural quantum else it might involve a question important to reliand an increase of crop in most cases attempted of crop, and all its productions being removed gion and philosophy. Yet I have remarked one by an enlargement of our fields, which seldom with inconceivable avidity, it cannot fail to ex-perience an annual deterioration, and will become less and less valuable until all its vegetable food is extracted, and then plaster of paris which has wrought this effect, simply through the ignorance or obstinacy of the farmer, will be abused as the operating cause of its decay. I have seen some lands in Maryland to all appearance so extremely sterile, as to render the cultivation of them an act of folly; but which, like the heath lands of England, contain a prodigious mass of dormant ve getable material. The bald gravelly hills about Washington City are soils of this description, and although naturally unfit for tillage, they are made to produce a ton of clover hay to the acre, by having their contents brought in operation through the agency of plaster. The most remarkable effects I have ever seen from plaster appeared on command of the farmer, a most dangerous engine in several instances, noticed a summary proceed-these lands, and I have known this invaluable to the interest of agriculture, and unless the insusceptibility destroyed, and the lands left com- strument be managed with propriety and care, it this end of reduction by a still speedier process. pletely destitute in four years by heavy plastering and repeated cuttings.

Lands originally rich, are always inclined to remain so; and I believe the reverse of the prothe owner of strong lands begins to remark a the belief that they have tired of plaster, they have been injured from using it, the seasons have proved less favourable, or that it results from mer learns to esteem the improvement of his all the victories which rapacity ever gained over many other causes which the farmer has always lity, or his own want of skill in agricultural proceedings; but although the decay may be slow and gradual, in proportion to the original vigor of never yet seen a soil from the St. Lawrence to the with which it executes its engagement, may inthe land, yet without the proper restoratives, its Mississippi, capable of sustaining the mal-applicaspire the farmer with unremitted confidence in ruin will be inevitable. Even the alluvion of tion of plaster, and all the multiplied robberies the punctuality of its performance. I have thrown Louisiana, which is composed almost exclusively of vegetable mould, and is perhaps the richest These enemies to husbandry, so invade our of attracting the attention of some of your read-soil in the world, (not even excepting that of the premises under the guise of friendship, and ers, and if they afford even a hint to future in-Nile, in its most renowned ages) is yet subject, under abusive management, to manifest injury and you find the wise planter, even in that favoured country, having recourse to restoratives, in improvement, or at least the preservation of our order to render his lands still more abundant and productive.

An important objection, however, may be offerare some lands, in Maryland, particularly those bounding on the Chesapeake, the Atlantic border, and generally on all salt rivers, where plaster is found to produce no visible effect. It is a difficult subject to venture on, but I should certainly incline to the opinion that these lands contain some properties to which plaster of paris bears a stronger affinity, than to vegetable or animal matter, that either neutralize or suspend its operations; and I am strengthened in this belief, from a knowledge of the fact, that these lands are neither injured nor benefitted from the use of plaster. If plaster of paris contained in itself food for vegetable life, it would furnish it on any soil, unless neutralized or prevented by some chemical process which it undergoes on the land, and if it particularly those bounding on the sea, contain large proportions of marine salts, to which sulphuric acid has a much stronger attraction than to earths. But low and flat lands generally, with-farmer seldom puts in a crop without previously out regard to location are invariably unfriendly manuring his land; and this provision saves

phenomenon in the capricious history of plaster of paris, which has given me infinite surprise .-There are many rich bottoms in Maryland, the effects from plaster will be most manifest, while and I sincerely lament they have not yet sufficient-

solving the mystery. But to return to my original part of the subjectof the hoof, the sickle, the scythe, and the sun. lands, is at this moment of much more importance to the agricultural interest of Maryland, than our immediate attention to the introduction ed to the theory of the action of plaster of paris of foreign and expensive breeds of stock, that on vegetable and animal matter only, for there favorite object of our Agricultural Society. To smith) and the father of a family, are two of the would be wandering from my present subject; these "the noblest work of God," where is the missionaries who insist on proceding the profession so enviable as the form. missionaries who insist on preceding civilization dividual of a great and agricultural country, I with christianity, and scatter their bibles and am truly delighted to congratulate you on the catechisms with wasteful profusion, like good and wholesome grain on the barren soil of savage life.

There are many estates in Maryland, originally poor, that have become in a few years under a judicious system of tillage, almost proverbial for their beauty and fertility; and when we reflect on the many facilities with which nature and art have furnished us for the attainment of this end, it becomes a still greater source of surprise to re mark the positive disregard to injury, with which a large majority of our farmers cultivate their acts as a preparer of vegetable substances, it would lands. Even in the vicinage of our commercial universally perform its office, unless prevented by cities, you find more hoof than herbage, and I similar operating causes.—We know that lands, contend wherever this exists 'tis impossible to improve land, unless by an expensive recourse to animal manure, which is too generally beyond the control of most farmers. In England the good

soil, exceeds even the hope of the farmer; but a greater capacity in retaining marine deposite But in Maryland, the plough and the harrow are fails to exceed in expense the expectations of the farmer, if it does not realise his hopes in additional revenue. To enrich a large farm from soil of which is composed evidently of the wash-the product of the barn-yard alone, is a tedious ings from the hills above. On these hills the process; and Providence, as if to remedy this deficiency, has given us the command of an abunon the very same soil, though in the valley, it dant vegetation, which is converted at the option exercises no apparent influence. These, howe-of the farmer to a useful or destructive purpose. ver, are investigations better adapted to the skill The practice however, of the Maryland farmer, and ingenuity of the chemist than the farmer, would indicate a determination on his part, to reduce his fields (in direct opposition to the ly attracted the attention of gentlemen capable of English mode I have mentioned) before he subjects them to a grain crop; and three years of unmerciful cutting and hoofing will never fail to however mysterious and contradictory the histo- secure to him this object, by rendering his lands ry of plaster may appear, we still know enough perfectly bare and destitute for flushing:—and, of its character, to prove that it places at the sir, with a blush I relate the anecdote—I have will speedily verify our gloomiest predictions in I allude to a custom which I forbear to locate, of producing ruin where benefit alone was intend-putting out clover lands to be mowed on shares; ed .- Whoever will take a view of the quantity of the undertaker to receive one half and carry it off, poor and unimproved land in Maryland, will not he- for cutting and securing the other, for the use of position will hold equally true. When, therefore, sitate to say (particularly when he remembers how the proprietor. It is perhaps inexpedient at any easily it may be improved by a proper recourse to time to speak too harshly of human errors, and I diminution in his crops, he may full himself with plaster), that our practice of farming requires the may have already been too severe in many of my earliest correction; and I conceive this change strictures, but this latter practice of the farmer, is will never be effectually wrought, until the far- the ne plus ultra of his ability to abuse; and, of land as a part of his annual revenue. He would good husbandry, it is the most signal and destruct at hand, rather than admit their declining ferti-then learn in the beginning to dispense with tive.—Like Arator's three-shift system it has the excessive cropping, and in the end he would have virtue of honesty alone to recommend it, for it the happiness to till better land; for I have promises to destroy the land; and the fidelity these remarks hastily together with the hope teach us to esteem them as real friends, while struction, on a subject equally important with any they devastate our property by unceasing attack. other in agriculture, my views are amply grati-I think an active and solicitous regard for the fied.

But yours, sir, is the pleasing task to instruct the husbandman to enrich his family, to adorn and beautify the face of his country, and to advance that profession, above all others the most useful and beautiful. "A Farmer (says Goldmanifold improvements in farming which have already resulted from your valuable exertions, and I trust there are those now living who will witness the accomplishment of the best views of our agricultural society. The interest and taste of the community are already enlisted in the cause of agriculture, and I predict its energies will follow as a natural consequence.

With great esteem, your's, H. V. SOMERVILLE.

Bloomsbury, May 20, 1824.

TO THE EDITOR OF THE AMERICAN FARMER.

Washington, Pennsylvania. DEAR SIR,

I send you by this day's mail, Mr. Hackney's to the action of plaster. It therefore appears, if him in the end an infinity of labour and expense, communication on the Peach Tree. I have test-the above conjecture as to marine influence be by securing to him as great a produce from one ed his plan, and consider it a good one. I have d

I of the ashes are both fatal to the embryo insect, of my gage plums.—The trees now look as heal-observe for the last three or four years, when and effectually destroy it. For a young and thy as I could wish. The failure of the peach proper care is taken, they are again doing well.—I healthful tree, a much smaller quantity will do, have over twenty trees still bearing, planted 26 as they are seldom disturbed by the insect, from years ago. The fruit is small, but well flavoured, the circumstance of their roots being less expos-

Many farmers, in my opinion, injure the health destruction was complete; in others, only partial. In our market we had always a tolerable shoots, almost uniformly come from the old stump, or from its roots. These shoots mostly bear the pruning, and am decidedly against using the second year. I am not prepared to say whether pruning hook at all. The reasons in favour of they will be as durable as trees raised from the Monoreabele in Fourte County of the tree to grow Monongahela, in Fayette County, you could not have found a peach tree in a day's ride. It was quite a common thing to send our frieads in Uniontown, parcels of peaches by the stage. I when raised in this way.

R. this plan are obvious. I suffer the tree to grow as nature pleases, and it will then assume a shape well calculated to withstand the shocks of storms, and some other kinds of forest trees, answer well and to bear its fruit without props. In pursuing an opposite plan, by cutting off the first branches a visit to a friend, who lives in a year, fine attletone the store of the county of the stage. that appear, a long body is formed and the tree ultimately divides into two or three main branches, which, when loaded with fruit, or during high winds, are apt to split asunder, and the death of the tree ensues. It is true, I have found it necesgan to notice the peach tree presenting a sickly appearance; and, in one mile farther west, not a living tree was to be found. The dry, dead skeletons presented a most dismal aspect; and vation of fruit trees, and willing to diffuse any is given the recent state. It is true, I have to make the recent sary sometimes to prop my trees, but in suffering sary sometimes to prop my trees, but in suffering their growth to be natural, they never acquire a great height, and form a peculiar shape, which skeletons presented a most dismal aspect; and vation of fruit trees, and willing to diffuse any is given them by nature, the load is so equally distributed, that the necessary propping is easily

> In addition to what I have already stated, it may not be improper to add, that an intelligent farmer informed me, that merely to heap the earth about the root of the tree in the fall of the

mention in this paper.

but I have a work in my library, printed in 1668, lowing facts in support of this assertion.

is inflamed it is likewise said to be the hoaks. In membrane away.

general the edge of this membrane is black, but sometimes we see it all white, and this difference years, greater improvements have been made in the ed. These efforts continue to be exertbe needful to give two pounds of salts, or a quart in case the of musick, is propagated to the whole of oil, and should it not have operated in sixteen system. It has long been a subject of complaint, ness of the mind in these, as well as in many other or twenty hours, it will be advisable to repeat the that the human species has been degenerating

There can be no doubt but those bullocks that they lived for a short time, would have taken an wonder how they moved, much more how they stagnate, and perspiration is increased, which is inflammation in their head, and this by the blood achieved such great exploits, beneath the weight carried off as fast as it is discharged from the acting as extraneous matter.

Baltimore, May 11, 1824.

GENERAL RULES FOR THE RESTORA-TION AND PRESERVATION OF HEALTH.

a portion of the time and industry of every ra-tional being ought to be employed in the acqui-sition of so desirable a state. For this purpose, nothing is more essential than a proper knowto remove, and frequently to obviate, the attack ed: but not too long a stay in the water at one been consumptive—so much does the gentle expected by the constitution, it is too long a stay in the water at one been consumptive—so much does the gentle expected by the consumptive—so much does the gentle expected by the lungs against all acciminate the productive of the most fatal exercise may be added skating, jumping, the active fluids towards the surface of the body.

Hence we are induced to explain and analyze,

that as in the most healthy state the horn is hol-individual, that an omission of such articles old:—women less than men. The natural vigour low, it must be absurd to treat it as a disease. It would be irreconcilable to our chief aim—that of of their constitution is such, that they suffer least is a fact that all animals of the same species, and exploding hurtful prejudices, and communicating from the want of it. This will explain the meanuseful information.

EXERCISE. Exercise may be defined such an agitation of the body as is conducive to health. Walking is the most gentle species of exercise. It promotes perspiration, and if not continued too long, invigorates and stregthens the system. As the most simple and wholesome drink, namely water, is within every body's reach, so this species of simple and wholesome exercise is in every body's power who has walking frequently up hill is recommended. The ing mountains, which these people undergo, adds knows how much walking up a hill tends to create an appetite. This depends upon its increasing achieved such great exploits, beneath the weight consequences.

Animal economy, therefore, ought certainly to form part of a liberal education. It is however, necessary nor is it convenient of the black that the body.

Riding in a chariot has but few advantages, like. Talking—reading with an audible voice— inasmuch as we are excluded from the benefit of not however, necessary nor is it convenient of the black that the body. general use and application, should never be this subject, "bloom to the latest ages upon the need of a more violent species.

grave of him who said, that, 'every time a man Riding on horseback is the most grave of him who said, that, 'every time a man laughs he adds something to his life."

ing, and shew the propriety of an opinion of Rosseau, who says, that, "Women only should follow those mechanical arts which require a sedentary life." But again, a man who is phlegmatic requires more frequent and violent exercise than he who is of a bilious constitution; and, lastly, people in warm climates and seasons, require less than those who live in cold. As Providence, by supplying the inhabitants of warm climates with so many of the spontaneous fruits of the earth, seems to have intended they should been bored, I have observed some of the animals the use of his limbs. To such as can bear it, labour less than the inhabitants of cold climates: so we may infer from this, that less exercise, which is only a substitute for labour, is necessary for them. The heat of such climates is sufficient of itself, to keep up a regular and due perspirayet the frequent and necessary exercise of climb tion. It may be observed, that the longest-lived people are to be found in warm climates. The coldness of northern climates, from the vigour it gives to the constitution, prompts to all kinds of exercise, which are not always restrained within proper bounds. These, when used to excess, wear out the body. The inhabitants of warm climates being less prompted to these things, their bodies continue longer unimpaired. The exercises hitherto mentioned may be termed active; the next are those of a passive nature. These are proper chiefly for valetudinareans. morning, the state of their manure be examined; -Sweating and perspiration have been found to The life of a sailor is environed with so many by making this observation, it will often enable be incompatible:—The former always suppress-dangers, that heaven has, in compensation for owners to detect disease, before the animal begins es the latter. Riding may be varied according to walking, pacing, trotting, or cantering our horse. All those diseases which are attended with a weakness of the nerves, such as the hysteric and hypochondriac disorders, which show themselves in a weakness of the stomach and bowels, indigestion, low spirits. &c. require this exercise, then (supposing you sup at eight common to this part of our country, to wit:—exhaustion, by a continual and unremitted course of cropping without any rest or improvement, by will promote the greatest discharge, in a given the usual auxiliaries, clover, plaster, or attention time, by insensible perspiration. Such as make to green dressings, farm yard manure, &c., it would be desirable, (if practicable) to fix the selves in a weakness of the stomach and bowels, indigestion, low spirits. &c. require this exercise. indigestion, low spirits, &c. require this exercise. It should be used with caution in the consumption, will avail nothing. The mind as well as the body must be roused from its languor. In taking an airing, as it is called, we ride over the same ground for the most part every day. We see no new ob-Upon this account long journies are recomthat they are able to digest raw flesh. In like properly into the plan here proposed, for exammended to such people, in order, by the variety manner it is, because these men are naturally or novelty of the journey, to awaken or divert the mind. Many have by these means been surprised into health. Persons who labour under cold climates; those who labour under hypochondriac or consumptive complaints, should visit before they renew their work.

With respect to the attention to exercise that should be recommended to those of studious habits, it is very generally observed that, how agreeable soever they may be to the mind, they are very far from being equally salutary to the body. The delicate springs of our frail machines lose vessels choked with obstructions, when we to-tally desist from exercise, and the consequences necessarily affect the brain: a mere studious life is therefore equally prejudicial to the body and the mind. The limbs, under such circumstances, become stiff; an awkward manner is contracted; and a certain disgustful air attends every action. An inclination to study is highly commendable; but it ought not to be carried to the extent of aversion to society and motion. The natural lot the house and leaned his hand upon the wall, and of man is to live among his fellows; and what- a serpent bit him."—Tegg's Book of Utility. of man is to live among his fellows; and what-ever may be his situation in the world, there are a thousand occasions wherein he must render himself agreeable; to be active and adroit; to dance with grace; to command the impetuous steed; to defend himself against an enemy; to preserve his life by dexterity, as by leaping, swimming, &c. Many rational causes have therefore given rise to the practice of particular exercises; and those legislators who deserve to be called the most sagacious and benevolent, have instituted opportunities for enabling youth who devote themselves to study, to become expert, also in laudable exercises.

"We shall walk, run, dance, swim, fence, sail, and ride to little purpose (says Dr. Tissot), un less we make choice of an agreeable friend to accompany us. Solitude is the bane of man; insomuch, that it is difficult to tell which suffers most, the soul in its qualities, or the body in its temperament, from being alone. Too great a concourse of people breeds disease. Too much company is destructive to cheerfulness. For the sake of both mind and body, therefore, we should move in a little circle, and let heaven circum scribe it for us. Let our wives and children be always around us; or, if we are not blessed with

manner it is, because these men are naturally pleso strong, that labour immediately after eating does not hurt them. But do we not observe, that such people leave their tables with reluctance: hysteric or epileptic disorders, should be sent to How slowly do they return,-and how many excuses do they form to loiter away a little time

tom would add several hours to every day, and their activity and become enervated, and the thus have the most beneficial effects upon the vessels choked with obstructions, when we to agriculture—commerce—and manufactures of would remain until the following spring, when it tally desist from exercise, and the consequences the country, exclusive of its influence upon the health of the inhabitants.

After what has been said, we need hardly add that exercise should never be used with a full stomach. Persons who use exercise, either to preserve or restore health, immediately after eating a hearty meal, resemble the man " who fled from a lion, and a bear met him; and who went into

recurring crops, especially those of the most important articles of produce, viz :-Wheat, Rye, Corn, Oats, Clover, &c., and for the purpose of uniting the grain and grazing system together, clutivating corn in grass lands, (on account of the and making the one subservient to the other, I cut worm, which generally infects fields of that propose the following plan, viz :- I chuse a cer tain number of fields, which shall be alternately either in grass or grain; for example-if the farm contains three hundred acres, rather more than one third would be requisite in timber, for fences, fuel, &c.—Say, however, one hundred acres; leaving two hundred acres for cultivation, which might be divided into five fields of thirtyfour acres each, a meadow containing twenty acres, if situation and soil would admit of it, and acres, if situation and soil would admit of it, and acres, a portion of the field intended for corn allowing ten acres for garden, house and yard, might be cultivated in oats, or the various root

" Exercise, it is said, from the seventh to the maintain a very large stock. Commencing our between the seventh and the eleventh hour, fortable and neat manner, or if the situation of with them (supposing they dine at two o'clock in the farm, or our means will not permit us to do and should never be violent, nor continued too the afternoon) is from nine in the evening till one so, it will be necessary (in going leisurely to long at a time. In riding to preserve health, eight or ten miles a day are sufficient to answer all the purposes we would wish for; but in riding, riding, and almost every other species of ding to restore health, these little excursions manly exercise we have described. It will be objected here, that we often see la-balance of the cleared land is to be equally dividbourers return, after a full meal, to their work, ed into five fields of thirty-four acres each .without feeling any inconvenience from it. This The object in view is to cultivate two fields every for the most part every day. We see no new objects to divert us, and the very consideration of raw flesh to the human species, because the for wheat in succession, until we come again to our riding for health, sinks our spirits so much, strongest and fiercest animals in nature eat it. No. 1, which will bring us to the fourth year that we receive more harm than good from it. It is because they are so fierce and so strong, from our commencement, and then we shall get

> No. 1 and 2 the 1st. year, 3 and 4 the 2d. year, 2 and 5 the 3d. year, 4 and 1 the 4th. year,

5 and 3 the 5th. year; which completes the course, and commences again with No. But farther: there is another reason why we 1 and 2. The first course and first year, I cultiwould recommend the practice of eating the vate No. 1 and 2-No. 1 in corn, which would chief meal in the evening, which is indeed a lit-tle foreign to this subject. In a country like this, fully cultivated with a view to laying it down in where the constant labour of every individual clover, which would remain until the fourth sumis so very necessary, the general use of this cus- mer or autumn, when it would be broken up, and sowed in wheat upon one ploughing. The fallow wheat or rve, and clover as in No. 1, and so on successively throughout the other fields. When the above plan had once got into complete opera-tion, each field would yield a crop of wheat after clover, and corn after wheat, once in three years; it would also afford one hundred acres of clover for pasture or mowing every summer-on which, with judicious management, a very considerable stock might be maintained. Clover fields are generally considered an excellent preparation for a crop of wheat; particularly, as the land would be in good heart, from deep and clean cultivation, manuring, plastering, &c. The above plan would also contribute much towards the destruction of Read at the last meeting of the Agricultural Soci-ety of the Valley, and by order of said Soci-ety, communicated for publication in the Ame-the common blue grass, which tends often to destroy our wheat and clover crops-for I think a No. III.

In order to establish a rotationary system of ter ploughing, (if practicable,) and a clean cultivation of corn, would, at any rate, make it manageable. This plan would also, entirely obviate the objection which we generally feel to cut worm, which generally infects fields of that description,) by presenting every season a stubble field for that purpose; and above all, it would beautify our country, by completely changing the face of those disgusting old fields so justly abhorred by every lover of good farming, and yet so generally prevalent in the present Virginia practices -If on so small a farm as above mentioned, it might be objected that too great a quantity of corn land would be cultivated-say thirty-four orchard, barn-yard, &c., and a few acres for crops recommended by experienced cultivators, agricultural experiments. Twenty acres of well such as mangel wurtzel, ruta baga, potatoes, car-

tions might be maintained on such a farm—a great quantity of manure might also be expected to be made on it with proper preparation, and the course sentence of learning," (so called in New Publication, shall select the course of learning, and the sentence of learning, and the sentence of learning that a sight, (whatever scribed in the following fanatics may say, or write against racing,) than lations" of the Board.

Article 6. The Course of learning, "(so called in New Publication, shall select the sentence of learning that a sight, (whatever scribed in the following fanatics may say, or write against racing,) than lations of the sentence of learning that a sight, (whatever scribed in the following fanatics may say, or write against racing,) than lations of the Board. requisite attention to that most necessary object.
The manure, (in my opinion) would be best applied to the field intended for corn and root crops, and publications are properly to the field intended for corn and root crops, &c.—In order to make the clover fields as profitable as possible, it would be well to have in reserve a quantity of rails for the purpose of dividing the fields; as it is well known that cattle thrive much better, when they are changed often, and that land generally is much improved by permitting the grass to rot on it.—A farm laid off and cultivated in the manner above described, when in complete operation, with neat fences, (live if possible) barn, and out houses of all describions, for a well improved homestead, would exhibit such a sight, "as might excite the sluggard to labour, and the most indolent to activity."

The above plan is submitted with deference to those who better understand the subject, by

writer. I speak so, because I have found by experience, editors of periodical papers, more inserted according to the direction of the 6th section of the act of incorporation; and, when so published, shall be distributed, under the direction of the first of the manner above described, than the request of those who defend the interest of virtue and religion. An assuming, insolent, overbearing manner, characterises all the advoverbearing manner, shows and spectacles; horse races, play actors, "et id omne genus." To this editors too often yield, and to avoid controversy, while they admit the ribaldry which offends the wiser and more virtuous part of the county societies.

The committee thus appointed and instructed, are desirous of entering on the discharge of the desirous of entering on the discharge of the desirous of entering on the officers of the county societies, to select from the archives of their respective institutions, such original articles as they may deem worthy of example the published such as it a votume of the first of the count incorporation; and, when so published, shall be interest of the such witers. It a votume of the first of the count incorporation; and, when so published shall be distributed, under the direction of the fore the advocation of the first of the such witers. The committee, those who better understand the subject, by THOMAS CRAMER.

00 TO THE EDITOR OF THE AMERICAN FARMER.

Dear Sir, I have been a reader of your paper from its first appearance, and, as far as certain circumstances and capacities permitted, have endeaobjects as cultivators of the earth, but as men and citizens. Hence the persuasions constantly held out to industry, sobriety, economy, and every moral virtue, and the open exhortations from idleness, dissipation, expense, and every vain and vicious indulgence. It is so well known a fact, that all the virtues are connected, and lead to one another, and all the vices in the same manner, that it has become a maxim out of dispute. To preserve this character and object to your paper then, it was necessary to exclude every thing of a contrary grounds, he abusively terms fanatics. necessary to exclude every thing of a contrary tendency to these virtues, which alone ensure tendency to these virtues, which alone ensure prosperity. As to virtue, it exists upon the conscientious obligation, within the mind, to what ness which endeavours to weaken it, and how will be always found the best citizens, patriots, much to be avoided by those who have general and friends of mankind. communications with their countrymen and mankind; printers of newspapers, and writings of every kind. You, with all others, as an editor, are to look at it, that nothing encouraging to dis-sipation, and injurious to morality, should find a place in what issues from your press. There with the other.

rots, &c. &c. If, according to Mr. Boardley's publication, signed Philip. He calls it "an acdefinition of grass, which he says, "is the sine qua non of live stock, the essential of dung, the nursery of corn, and of all farming purposes," whose name black or white, bond or free, denursely of corn, and of all farming purposes, between the good derivable from it, would be serves to be known; and the emulation "and sall the good derivable from it, would be gracity of the noble horse, worthy of his name and gracity of the purpose of the state, and gratuitously distributed among the farmers of North Carolina, through the agency of the country agricultural societies.

The Board of Agriculture, at its meeting last gracity of the noble horse, worthy of his name and attached to a farm cultivated as above described; gacity of the noble horse, worthy of his name and as the land would be in a progressive state of improvement, under such cultivation.—With good management, a considerable stock of all descriptions might be maintained on such a farm—a great quantity of manure might also be averaged.

Upon this I beg the same privilege of remark, and publication, that you have allowed to that writer. I speak so, because I have found by ex-

count is given of the race, the rider and the horse. Change the case, and the terms are suit- that they will likewise gladly receive, from praced to the interests of struggling nations, the perils of patriots, and the eventful movements of mankind. How superlatively ridiculous are the terms applied to a running of two or three State.
beasts, and how much below the dignity of rational men, is the interest expressed on the occasion.—But what is the meaning of "the emulation and sagacity of the noble horse, worthy of stances and capacities permitted, nave endeavoured to contribute to it, upon the principle of
its being useful to our fellow citizens engaged in
agriculture. But in this, not only as it suggested
and directed improvements in their labours and
or the noble crowd around him — And he save or the noble crowd around him?—And he says, Committee of Selection and Publication, with "I had rather a son of mine should have had their places of residence. the benefit of such a sight, than a twelvemonth's schooling."-Truly a horse must be a noble instructor to a son, and the son become worthy of the father. To complete the whole, he couples the contempt of learning with the privilege of religion; whose serious professors to a man,

horses, and genealogies of colts and fillies, their is right; and conscience inevitably refers to a witness having it—that is, God; and a fear of him, governing our actions, is religion. As this is the foundation of all virtue and happiness, what expression is suited to the folly and madwhale which endeavours to make it and hilles, their sires and grandams, though better in sporting magazines, at least preserve your sheets pure from insults to the most sober, considerate, and felling part of the society, the moral and religious men, who, though not ennobling horses, will be always found the best citizens.

JAMES.

Baltimore, May 19, 1824.

-0-From the Western Carolinian.

I am led to offer you these observations, from certain specific objects; among these objects, one in oats, and I shall take mine down in a day or reading yesterday in the Farmer of the 14th instant, a letter from a horse racer, intended for of agriculture and rural economy: fifteen hunno expense attending it, the oats are not injured,

TO PREVENT SKIPPERS IN BACON. MR. SKINNER,

One of your correspondents, some time ago, recommended packing hams in dry oats, to pre-

vent their being injured by skippers.

In the year 1822, having plenty of coarse salt on hand, I prepared dry casks, placed the hams and shoulders on their ends, and filled the interstices with dry coarse salt, covered the tops completely with salt, and settled it well; about midsummer, I unpacked and examined the hams, replaced them again in the casks as before, and drew them out for use when required, there was not one skipper found, and the bacon was fine. Last year not having a sufficiency of salt, I packed my hams and shoulders in dry oats, in the seems a special regard to these, necessary in a paper urging the obligations of industry, frugality, and prudent management; for they are in
1822, passed an act "to promote agriculture and packed in salt. I have not seen a single skipper consistent with each other. Prosperity and peace family domestic manufactures in this state;" by on bacon so treated; but I have, before I adopted are inmates with the one, trouble and penury the 10th section of which, a Board of Agriculthis method, been sometimes very much injured ture was incorporated, with means to accomplish by them. It is now the right time to pack hams

they can be used when you have your old hams in the fall, and I would advise a general adoption of this method. It is very little trouble to unpack them, and it may be best to examine them two or three times in the summer-it changes their position. When two pieces touch each other they may get mouldy, but being very particular to see mine well separated by the oats, not one would have injured if they had remained until the fall without being drawn.

TO THE EDITOR OF THE AMERICAN FARMER.

SOAP MAKING-BY THE "COLD PROCESS." Albemarle, Va. May 15, 1824.

MR. SKINNER.

It is my custom, in reading over your valuable journal, whenever I come across any article relating to domestic economy, to read it out to my wife, who, you must know, is a notable manager and great economist. In the 4th No. of the Farmer, a process of making soap, is detailed by a housekeeper, of simply mixing the ley and grease together, and placing it in the hot sun, without any boiling. When I read this account to her, which is wound up by the emphatic enquiry on your part, "can this be true?" "True! said she, certainly it is true; I have made soap in no other way for three years, and I believe every body in this neighbourhood does the like—only I do not take the trouble to measure the ley and grease, and set it in the hot sun, but I put my barrel, (a common fish barrel) in the cellar where it is intended to stand, and fill it nearly full of strong ley, then add as much grease, without melting it, as I think sufficient, stirring it once every day or two. In a few days I can tell whether I have put too much or too little grease, and add ley or grease as the case may require. In two or three weeks it becomes excellent soap. We call it the entirely destroyed by frost apparently not half cold process. In this way we make better soap, as severe as what we have had this year. If this get rid of the trouble and rich of helling as the fact, what can be the countries of helling and rich of helling and rich of helling as severe as what we have had this year. get rid of the trouble and risk of boiling, and can be the fact, what can be the cause that the same 75—Do. Untrimmed, \$5 75—Ginseng, 30 cts. make it as suits our convenience, or occasion requires. And I wish my dear, that you would different seasons." write to Mr. Skinner and tell him from me, that it is true. And besides, you have not written to Mr. S. for a long time, and he is very kind and attentive in sending you valuable seeds-and moreover, we hear that he is sick-and I should be glad to hear that he is getting better."

I forthwith sat down, and have given you her own words, as many of which she says you are at liberty to use, as you think necessary to support or confirm the cold process of making soap.

ON THE CULTURE OF ROSE BUSHES.

Translated from the French.

Roses are increased by seed, buds, layers or shoots, and by graft on other rose bushes.

The rose from the seed comes slowly; but it diversifies varieties.

The most usual method to multiply roses is by buds and lavers.

Grafting succeeds better than budding with the choicest roses.

Plant not rose bushes either during frosts or great heat.

Dry earth causes more fragrance, and higher and stronger colours.

Moist earth larger roses, less colour, and slower and later growth.

The rose will not flourish in pots or boxes, on account of its numerous roots.

The blooming of yellow roses may be anticipated, by pulling off the buds and leaving but a few The hundred leaved rose will not flourish in

The white double rose stifles the growth or those near it; particularly the yellow rose.

Pruning agrees generally with every species of rose, except the yellow and the musk-rose.

If rose bushes are watered with a ley made from the ashes of burnt rose bushes, the salts contained in it will wonderfully contribute to their

The Season .- Some of our oldest inhabitants do not recollect of a season so backward as this has been. It is now the middle of May, and the cold is so severe that it is necessary to keep up fires in our parlours, and vegetation has received that on Friday last, the air at that place was filled with falling snow flakes, and that the sky exhibited the wildness and sternness of March weather. We had letters recently from New Orleans, which state that similar unseasonable weather was prevailing there in the middle of April.

Near Selma, (Alab.) 2d April, 1824.

DEAR SIR,

I now send you by Col. McLaughlin, a head of grows very tall in this climate, and has a beautiful appearance. It should be planted in checks, as Indian Corn, and not more than three stalks left in each check; and they as far apart as may be. It puts out a number of suckers from each fully maintained. stalk, which should be left, as there will in a very short time, be no difference in their appearance; and there will be no difference in their production. It will answer, I think, very well for soiling, as horses are very fond of it when green; and it very soon takes a second and vigorous to spangled-it came in good condition to market. growth. It grows with us, ten or twelve feet high, and bears frequently, several heads on one stalk. It takes very strong root, and is, even in the Spring, difficult to eradicate without the hoe or mattock.

I have a plough in use, not peculiar to me, of which I think very highly for the breaking up of tar, read H. Bicolor-melicaglabra, read melica glabra. new land. I have never seen any mention of such an one in your paper; and there is no plough any thing like it in the Patent Office. When I have more leisure than I have at present, I will probably give you a description of it.

TIE FARMER.

BALTIMORE, FRIDAY, MAY 21, 1824.

Memorandum of seeds sent to the Editor since last report, for distribution.

MILLET, of a productive kind from R. P. Bry arly, Esq. of Martinsburg, Virginia.

EARLY BLACK SEED COTTON, from H. V. Somerville, Esq. of Baltimore county; and our friend remarks that, "this seed is very highly esteemed in Louisiana on account of its texture, rapid maturity, and great facility in being ginn'd

or picked."
NUBIAN SENNA, from Gen. Thomas Pinckney, of South Carolina, with the following remarks: "The few seeds sent herewith, are of the Nubian Senna, the plants were raised originally in this state from seed found among the imported Senna. I have cultivated it more than twenty years, and found it a valuable domestic medicine, a very serious check by the prevalence of the having the same effect as the imported. If sown north winds. It is stated in the Salem Observer, as soon as you receive it (when I are the imported). as soon as you receive it (when I presume it will be free from the dangers of frost) you will have an opportunity of observing whether it will suit your climate. The leaf being the part which is used, I have no doubt you will obtain sufficient of that part of the plant of good quality; and if the seed should not arrive at maturity you may always be supplied with it from hence."

ALICANT WATER-MELON AND MUSK-MELON SEED, from J. Lowell, Esq. of Roxbury, Mas-

sachusetts.

"Tennessee is beginning to see the importance PRICES OF COUNTRY PRODUCE—carefully collected every Thursday, for the American Farmer. By ROGERS & STMINGTON.

example of some of her sister States.—One Agricultural society is already formed, and I hope in a few years, such societies will become common throughout the States.

AGRICULTURE.

PROCEEDINGS OF THE WASHINGTON AGRICULTU-RAL SOCIETY OF EAST TENNESSEE.

According to the provision of the constitution, the society met on Monday 12th April, 1824, when the business of the society was opened with an address from the president. Subsequently interesting communications were read from David most approved model of a plough for the use of the members. The second on the propriety of procuring from approved sources, some seeds of valuable plants, &c. not yet cultivated among us. The third proposing several highly useful and interesting experiments-all which were referred. rican Farmer, edited by J. S. Skinner in Baltimore, for the immediate use of the society.

After the President had retired, the Vice-President took the chair, when the following resolutions were adopted.

can Economist.

use of the members.

shall endeavour to proceed directly to the discharge of this duty, without detaining you to make, with read or affected modesty, unavailing premarks upon my consclous insufficiency to discharge as lought, or would wish, the part assigned to me by your kind partiality. The importance of winter fodder was made from the poor animals fed on straw, and the scant yemployment is the source of all good; it is virtue charge as lought, or would wish, the part assigned to me by your kind partiality. The importance of agriculture to the interests of civilized proved state of agriculture, is to commentary the conceded that, civilization itself has been much advanced in most countries by the improved progress of agriculture: and if in all countries, it has not kept pace with this, it is to be ascribed chiefly to the political condition of some, hostile in their character to freedom and rational improvement. If the great advantage of agriculture generally is admitted, its improvement in this section of country will doubtless be hailed with much interest by the whole community. It is for the purpose of improving the condition of this important art, and advancing in a correspondent degree our interests, that this agricultural society has been instituted; and if it is correspondent degree our interests, that this agricultural society has been instituted; and if it is really expected to the thing the expectation of the means are also as a trained a degree of splendid seem to be superrogation to attempt to prove by argument or illustration, a proposition so self-evident, as that a proper association of individuals for the improvement of agricultural practices, and the control of the creating and the proposition of the control of the creating and the proposition of the creating the control of the creating and the proposition of the creating the control of the creating and the proposition of the creating that the effect of these means, was less elsewhere.

In further confirmation of the great advantages is it is the nature of sensib

Watkins, M. D. President of the Society. meeting on 12th April, 1824, by Thomas G. Warkins, M. D. President of the Society.

Gentlemen of the Agricultural Society.

According to the provisions of the constitution, our members are met for the first time, to enter upon the objects for which the society has been instituted; and as it becomes the duty of the presiding member, to call the attention of the society to subjects proper for its consideration—I shall endeavour to proceed directly to the discharge of this duty, without detaining you to make, with real or affected modesty, unavailing hard earnings and savings in other products; or point of view. If idleness is the root of all evil.

more success than individual efforts, but when we cited; it would be a hopeless task to convince, or reflect upon the remarkable indifference, if not being convinced, are not already roused to a spirit disinclination, in more enlightened parts of our of emulation by such profitable and commendable country, to encourage and support agricultural examples, it were needless to attempt to stimula e societies; together with the former apparent further. But to render the efforts of the society apathy and long neglect of the subject, in our actually profitable to the members and the commore immediate vicinity—the propriety of such munity at large, adequate means are required.

These consist in money and intelligence—Wash-To enable us to form a correct estimate of the ington and Carter counties I am persuaded are obtained at home, with equal, or nearly equal moderate in circumstances, so small a sum has convenience and advantage—I will call your attention to agricultural institutions in America alone, as affording all the evidences requisite to satisfy the most sceptical judgment in the case.

The first society for premating agricultural institutions are all society of the society and agricultural fest inducement to contributions to an agricultural society of the society of the society.

From that valuable source of intelligence, the was bad in the extreme. It consisted in a series as from other sources; we cannot lack the necesor exhausting grain crops, with scarcely any in- sary materials for agricultural science, and our wille, Huntsville, in Alabama, and other places of the soils and climates of our neighbouring brewest and southwest of us, have afforded a ready thren; but we may without injustice or impromarket for all our flour, rarely less than six, and priety, set forth the advantages of our own: and Gentlemen of the Committee of Correspondence, ticles of domestic manufacture, &c. &c. to Virmium, upon an exchange for their own-which their mills, machines, and various works; we have in addition the most numerous and admiraand an inexhaustible excess for exportation. The Virginia, to southwest point-from the Cumberland mountains in Kentucky, to the confines of Georgia, and the Indian nations; abounds with convenient navigable streams, inviting to exporspirit, susceptible of extraordinary improvement. Then what remains to our interest but to be up and a doing? instead of improving these resources however, we are daily diminishing the productiveness of our lands! In the year 1812, just before I left my Caveland estate among you in Jefferson county-to obey the call of my country then involved in war-I raised on a forty acre field, fortyeight bushels and three pecks of corn to the acre; the average crop, as I find noted on my agricultural journal of that year. Last year, upon my return among you, the same field was particularly well tended, and the season throughout was remarkably favourable for corn-but it vielded now of this same grain, a fraction less than twen-ty bushels per acre. The old manager and management are dismissed; and if the present one engaged there, can be induced to remain so long, or my health and other circumstances will admit of my own occasional attendance there; I do not despair of being able to report the renovation of that same soil, to the point of producing more than forty bushels to the acre, within four or five years; with an annual yield in the mean timemore than compensating for the expense of liming, clover, and plaster, &c. The more enterprising and active inhabitants of Alabama, Mississippi, West Tennessee, Kentucky, Missouri, and Ohio, &c. besides pushing their exertions ahead of us, for agricultural productions and improvement, have had the address, to bring into high reputation amongst the residents of all our various atlantic regions; the superior advantages of their different soils and climates, and induce

sometimes as high as ten and even twelve dollars if they do not hold out superior inducements to a barrel. What a fine chance if we had been pre-all—from congeniality of climate, water, soil, pared for it. But such has been the bad state of habits, &c. they are certainly worthy of the parour agriculture that, during this favourable time ticular attention of many of our atlantic, or at least for drawing the means from abroad, of relieving cismontain atlantic fellow citizens. There is beour embarrasments or improving our resources tween the soils, climates and water, as well as at home; our farmers have scarcely afforded a habits of the people living along the limestone sufficiency of good merchantable wheat for our vallies of Pennsylvania, Maryland, and Virginia, own consumption. During this same period too, and all the country of East Tennessee, a remarkwe have had the mortification to see the more able correspondence: and as to climate and face enterprising Kentuckians, whom we should wish of the country, and the customs and manners of to emulate in every thing but their new ways to the people, this congeniality extends to most of pay old debts,-carrying through every section of the middle and up country of Virginia, North and our country, hogs, horses, cattle, mules, and ar- South Carolina and Georgia, and many parts of Maryland. And can any portion of our favoured sented areginia, North and South Carolina, and Georgia, Union be remarked, for enjoying more robust and other parts, several hundred miles nearer to health, than our whole country of East Tennesus, and returning with "good" money to reward see, from, and including the equally favoured vi-them with additional profit in the form of a prethat it is far from the disposition of those, whom answers their necessary purposes at home.— I have now the honour to address; as I hope it is Whence this contrast in their and our proceed- from my own principles, to throw out any unwar-I have now the honour to address; as I hope it is rage them to activity and energy, while nothing emigrants in their chosen course to other climes; hausting the substance of our capital—and work rage them to activity and energy, while nothing emigrants in their chosen course to other climes; away. But if our land is not in a condition for If they have fertile soils—so have we. If they have climate, and health, and resources to convert my positive that character course to other climates; profitable cultivation, it is because we have not tive habitations. Maryland and Virginia, the one have the called the convert my positive the called the call have climate, and health, and resources to convert my native, the other long my adopted home; still these to productive purposes -so have we: and if claim the reversion of my best affections: and not improved it if otherwise. If we have not althey have horse and artificial power, to move after many a melancholy retrospect, my imagi- ready cleared our land, it is worthy of attention nation has yet too often to be recalled from the alienated lands of my fathers. Could I under ble streams and sites for every species of water these circumstances, honestly hold out delusive works. And this more favoured section abounds inducements to others, to entice them from the with the best ores for implements of husbandry; abodes of their nativity? But to all whom these no longer afford the indispensible blessings of whole face of our country too, from Abingdon in health, peace and competence, our cheap, fertile, and salubrious soils, and climate, offer fair prospects, hitherto, too inconsiderately perhaps, postponed for others less congenial to the constitutions, or propitious to the hopes of those abandontation; and with a moderate exertion of public ing from choice or necessity, the sections of country more particularly pointed out to you. Corn, wheat, rye, oats, barley—all the grains and grasses-all that appertains to the support and prosperity of the true farmer, strictly so called; abundantly flourish and insure a comfortable subsistence, and a happy independence here.

The overflowing population of our atlantic cities, the paupers that burthen and disgrace their streets; all the unemployed who, sighing want, and wanting sigh-what a little exertion in such a situation, without burthening any, would command them the comforts of life-the sweets, and we may add the virtues of independence. Then why so little known, have the advantages of this country been so long passed over. The fault is in ourselves, gentlemen, and not in our country. The beneficent hand of God has left no resource for our pride in such an apology for our improvident remissness. But it is not too late. The sedge fields, land galls, and gullies already among us, form it is true an admonishing contrast; to the uncultivated wilds and caney thickets, wrested from the fierce savage, within the recollection of many of you, still comparatively young men.— These things do certainly admonish us that, if it is not too late, the time has arrived, when we; instead of inviting emigration amongst us, must begin to improve, or emigrate ourselves. But, can there be a soul so torpid here, that would be forced off, to swell the speculative price of others' lands; sooner than roused to enhance the value of fitable, and at the same time putting a fair and their emigration amongst them. We would not choose illiberally to disparage the rich advantages us, the residence of good monied or experienced of the mud—the diligence, accuracy, and skill, of

Gentlemen of the Committee of Correspondence, The constitution of our society, imposes upon you, an interesting duty in the practical prosecution, of its use ul objects. To collect and condense in one view before the society-from any member of the community or other sources; whatever may be made useful to agriculture, and again to diffuse it more generally, improved by your own experience and enlightened touches. The interest and importance of this department of our institution is so obvious, that I shall be pardoned-perhaps I had better have said-justified, for calling the attention of the members to the subject intended, more particularly to be embraced by it. Under this view, amongst the objects to be pre-

1. The land we live on. Is it in a condition for the best agricultural purposes? if not, how is it with the greatest speed and economy of labour and means to be made so? If our land is already in the best condition for ample production, nothing remains, but to satisfy ourselves of the true means of obtaining the greatest interest, without exto consider well and learn the best means of doing this, with respect to the saving of timber, and the just claims of posterity and our own future prospects, as well as present interest and convenience. My limits will not admit here, of any detail upon the best means of arranging judiciously our plans in first opening, and making improve-ments upon our land:—and to point out the best modes of restoring and improving its fertility. when previously wasted, or not originally goodwill be the future business of this society.

(To be concluded in our next.)

DO 0 ON RECLAIMED MARSH-MEADOWS.

The following are the answers of the Corresponding Secretary of the Agricultural Society of Pennsylvania, to enquiries submitted to him by the President of the Maryland Agricultural

With the management of meadow, I am made familiar, by having had nearly a thousand acres of reclaimed marsh, under my control for some years -To your inquiries I reply:

1. "The height of the bank above the surface of the marsh, its width at the base, and at the top," are accommodated, to the force of the current, the peculiarities of position, affected sometimes by an increase of alluvion on the opposite shore, the interposition of an island, the deposite of a wreck, and always by the materials of which the bank is composed. The tenacity of the mud, is an essential item for consideration. If the bank be faced with stone, at the points of most expo-sure, or be defended by planks, or be protected by such expedients, as small wharves, or sunken hulks, less width at the base, will be required.

2. "The number and size of the sluices," depend upon local circumstances—the comparative height of the circumjacent land-the intervention of small streams, or natural water courses, which carry in certain cases, large portions of the water, to few points.

3. The condition of the marsh, the time which his own and neighbours; by making it more pro- must have elapsed before an esculent can be grown upon a marsh, depends upon its relative ot e

melioration of the soil, since the leakage of the absence. In that of the 9th, I observe the exbanks, the defects in the position of the sluices— pression of your wish to be furnished with infor the mistakes in the direction of the lesser drains, which experience only can correct, generally de-feat the early expectations of profit.

4. I have never seen a "good crop of wheat growing upon any reclaimed marsh." There is no question that bad crops of wheat, have been taken from some of the highest marsh meadow not far from Philadelphia. The heavy fogs produced mildew, and the superabundant strength of soil caused the crops to run into straw, and to fall. The surface I am told, was six feet, "above the level of low water mark." I am satisfied, that a good crop of wheat, cannot be made upon any marsh, with which I am acquainted.
5. I have seen luxuriant crops of rye, and

above low water mark.

6. Such meadow, in the improved parts of this state, is applied almost exclusively, to the pro-duction of grass. For this purpose, it produces it, which are within three miles of Philadelphia, produce from ten, to twelve dollars per annum. All taxes, excepting the bank tax, and all expen ducing the inequalities of its surface, or destroying noxious pests, ransted, thistles, elders, and other weeds with which it may be infested. Its fertility, appears to be almost inexhaustible. I have known acre of the best marsh, will make heavy with fat, six hundred pounds of beef, which shall have been put upon it, wretchedly poor, early in May, and be removed as early in November.

7. "Herds grass, or red top," is not allowed to grow upon well drained marshes. It will flourish, where no other grass that I have seen, can live. It is much used upon the ill drained meadows of Jersey. I have heard it asserted, and believe, that it may be sown with so much effect, upon very wet meadows, free from rushes, that a waggon may at the end of four years, pass, where an ox, with difficulty at the commencement of the term, could have moved. "Timothy" is valuable for sale, unless it be mixed with clover. They to blast very fair prospects. consider it, ill fitted for pasturage, as it shoots less vigorously, and less frequently, after having been once cut, than any artificial grass we possess: and they condemn it as affording hay less nutritious, than all, except herds grass. It is sown upon marsh, allowed to go out, and to be succeeded, by white clover, and green grass, 8. "Oats" have never been tried I believe, ex-

upon very old well reclaimed marsh.

I am with great esteem, most truly vour's, JOHN HARE POWEL.

300 TO THE EDITOR OF THE AMERICAN FARMER.

AGRICULTURAL REPORT FROM THE COUN TIES THEREIN MENTIONED, IN VIRGINIA. Bonbrook, Cumberland, Co. Va. May 14.

him by whom it has been managed. I should say perused the Nos. of the Farmer of April 9th, than I have ever known before in a whole season, three years would be required, for the tolerable and subsequent, which were received during my On the 27th and 28th of last month, they were mation respecting "the effects of the season, and the prospect of the various crops, &c." Having been, myself, so often gratified and instructed by the contributions of others, to your valuable jour nal, I feel myself under some obligation to meet your wishes by the offer of the mite of materials, which my late excursion enabled me to collect, towards the report which you are desirous to pre sent to your readers.

My route having led me by Cartersville, on James River, by Orange and Culpepper Court Houses, by Chester's gap, in the Blue Ridge, and by Winchester, in Frederick county, gave me a passing view of a portion of the country stretching eastward from the S. W. mountains, of that beabundant crops of indian corn, upon marsh, of tween the latter and the Blue Ridge, and of the which, the surface is about four feet, and a half, great Valley of Shenandoah. I found appearances, throughout, more favourable than report had led me to expect. The coolness and wetness of the autumnal season, followed by a winter almost without snow, yet except the month of January, from eight to nine dollars per acre, upon a lease of the strictest kind, prohibiting the removal of ly retarded the growth of the winter crops; and hay, and admission of horses. Some portions of the opening of vegetation, in the spring, was backward and slow; all conspiring to give but an un-favourable prospect of the ensuing harvest.— I was much gratified throughout my late ex-I remarked, nevertheless, that less than usual of ses, attending the repair of the ditches, are paid the grain had been winter-killed—particularly, state of the crops of clover. You are aware, by the tenants. No man cultivates a farinaceous crop, upon this side of the Blue-Ridge. On the western that, for several years last past, its growth has crop, upon this land, but with the view, of reside, the injury, by the successive freezings and been comparatively feeble, and that great and thawings of the winter, had been greater, and the discouraging difficulties have been encountered in comparative appearance of the crops, in general, attempts to propagate it. So much so, indeed, less promising. A sojourner, however, of eight as to impress a general belief that the land had or ten days, in Berkley, during the latter part of become clover-sick. In this quarter, where the repeated crops of maize, taken in succession. One April and the first week of this month, furnished clover culture has been but few years introduced me with opportunity to observe a very obvious into our husbandry, the same difficulties have change for the better, in the progressive and vi-been realized, in the same years; while the last gorous advances of vegetation; and, to remark, and the present seasons have proved peculiarly on my return, through the counties of Culpeppe:, propitious. No greater success attended our ef-Madison, and Orange, a decided improvement in forts in past years, to propagate it in land which the wheat and rye crops there. In these counties, had not been clovered, than in those which had; indeed, or as much of them, at least, as falls with nor do I perceive that it is, now, less flourishing in view from the road, I have rarely seen more in the latter than in the former. Do not these flattering indications of a good harvest; especial-facts render it probable that a good deal of what ly, where an improved system of husbandry has has been ascribed to clover-sickness in the soil, is been ado sted. I heard, indeed, some complaint of measurably, at least, attributable to the peculiar consider ble injury by the hessian fly, and very character of the past seasons? No small portion probably, not without cause, though I saw but of it might, it is probable, be fairly charged to little appearance of it. It was about the period the account of close and untimely grazing, and to I conceive, only for the uses of turf, or road when the effects of their ravages usually begin excessive exactions of crops. Having filled my horses. Our graziers, or farmers cultivate it but to be perceivable, and they have still ample time sheet I must conclude with subscribing myself,

The James River lands, so far as I have seen, promise an abundant crop. In this county, (south of that river) as far, however, as I have had op- 14th inst. which I have just received, that rain portunity to observe since my return, the wheat begins to be wanted in the region of Baltimore. which is our only winter crop, though rather more backward than usual, promises not unfavourably tinues to be cloudy and wet. Dry weather and should it be able to withstand the fly, which we sunshine "are much wanted."

J. P. W. find to be already very numerous; and the chinch-8. "Oats" have never been tried I believe, except as a protecting crop, for timothy: when they bug, which, from the great numbers in which it attacked our corn during last season, we have lished per annum in Great Britain, on 600 of much reason to dread; the more especially, too, which there is a commercial loss, on 200 no gain, as the principal part of the wheat grown in this on 100 a trifling gain, and only on 100 ary consists. country, is sown upon corn land.

tains: but on the south side of James River, the rains, if they have not been more frequent, have certainly been heavier than to the northward of it. Our lands have been literally drenched with them, for three months past; and our waters more frequently swelled out into the low grounds, and of the 30,000 published in the tains: but on the south side of James River, the worth reprinting, and not more than 300 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 300 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting, and not more than 500 are considered worth reprinting and not more than 500 are considered worth reprinting and not more than 500 are considered worth reprinting and not m Having recently returned from a visit to the them, for three months past; and our waters only 500 works of writers of all nation county of Berkley, in this state, I have but just more frequently swelled out into the low grounds, sustained the devouring influence of time.

raised higher, I am told, (for I was then absent) han they have been for perhaps fifty years. Of course all the plant beds upon the low grounds, (and most of them, in this section of the state are made there), were flooded and much injured, and many of them entirely destroyed. Even those in elevated situations, have been so long and so constantly saturated either with rain, or the water oozing from the lands adjacent, as to be in many cases little better off. The plant-flies, too, to help on with the work of destruction, have attacked the young plants in vast numbers, and fa-voured as they have been, by a continued spell of wet and cloudy weather, their ravages have been very extensive and injurious. Great preparation had been made in this part of the state, for an abundant supply of plants, in order to insure an early pitching of the crop, much having been lost last year by frost; but, with present prospects a great scarcity is inevitable. Add, to all this, the interruption of the work of preparing for the summer crops, and the impossibility of doing any thing with low grounds naturally very moist, which has so far, in many instances, prevented even the planting of corn, in such situations; and you will see that there is more of gloom than en-

cursion, in observing the revived and flourishing

Very respectfully, your's, &c.
JOHN P. WILSON.

P. S. May 19th.- I see by the Farmer of the

derable profit-700 are forgotten within the year, Our prospects in regard to the crop of tobacco, other 100 in two years, other 150 in three years, which is the principal staple of this and the adjoining counties, are much more gloomy. The winter has been very wet, I believe, throughout the state, and particularly eastward of the mounties, and particularly eastward of the mounties and of the 30,000 published in the counties are thought of the 30,000 published in the counties are thought of the 30,000 published in the counties are thought of the 30,000 published in the counties are thought of the 30,000 published in the counties are thought of the south with the years, other 150 in three years, other 150 in three years, other 150 in three years, and scarcely 10 are thought of 20 years. Of the 50,500 books published in the 30,000 published in the counties are thought of the 30,000 published in the counties.

Read at the last meeting of the Agricultural Society of the Valley, and by order of said society, communicated for publication in the American Farmer.

Answers to questions (proposed by the society to its different members), by Major S. Mason, best land. of Frederick County, Virginia.

Q. How long have you used plaster?

A. I commenced the use of plaster in the fall or autumn of 1815, with a few bushels, which I strewed on the poorest part of a fallow field and harrowed in, with the seed wheat, and am confident that the crop was doubled by it.

Q. In what state was your ground, when you

began to use it?

A. My land was generally poor, with the exception of a few acres of manured land, and some

Q. What quantity per acre have you generally used?

A. I have generally used about a bushel to the acre, but on clover, frequently not more than half paration, with a view to avoid the effects of smut it has had. a bushel, and have seen but little difference, if any, in wheat, on the clover between the use of a bushel and half

A. I ha a bushel.

Q. What soils are most proper for that manure? A. About one half of my farm, is what is generally called mixed lands, being slaty on the surface and limestone under it, and some parts of it but I afterwards found it necessary to sow some I have suffered no clover to remain more than shewing limestone uppermost; on this land I have of the smutty wheat, on the same field, which two years and a half—ploughing it up, after sownever used plaster, without visible, indeed great was sowed about the 25th September, and I could ing the seed the second time the land is much benefit, either on corn, wheat, or clover. The not find a smutty head next year in the field; on the other half of my farm, is limestone land, with a the 9th of October, I sowed some of the smutty certainly be better to let it remain there a few small appearance of flint, in two or three places; I have certainly profitted by the use of plaster on siderably injured by smut. Some of the same this also, though not half, perhaps not a fourth wheat, mixed with clean seed, was sowed the 19th ripens at the same time and I think helps to keep as much as on the other.

what effect?

annually, and as yet with good effect, but have that early seeding, is the only necessary precaubenefitted the wheat most, when I harrowed it ion against smut. in with the seed, and think also that clover sown Q. What is cons on uch land succeeds best with me.

Q. In consequence, do you find, that it renders the earth sterile, after its effects are gone?

A. This question is answered by the preced-

ing answer.
Q. To what products, can it be best appliedgrain, and what kinds; grasses, and what kinds?

A. I have used plaster generally with good effect on my wheat and oats, and also by rolling or sprinkling my corn, but think it is used most pro-fitably on clover, though as yet I have continued fallow land? its general use, and believe my land is nearly doubled in fertility by it.

Q. What is the best time to scatter it?

A. I prefer strewing it, on clover, in the early part of April, and to harrow it in with the wheat

when seeded.

Q. What is the greatest produce of grass per

A. To this question, I cannot answer positively, but think I have moved a ton and half or two tons from land, which, without plaster, would or beds of six or eight feet wide. not have produced more than half a ton, if that. Q. What do you consider, has be

the plaster alone?

been previously manured, and raised very fine than 15 bushels per acre, including the last year. crops, but how far success was attributable to the Q. What kind of wheat, do you generally cul- prevent or cure rheumatisms, catarrhs, or such plaster I cannot say, but have no doubt it aids the tivate, and which is considered the most produc- cutaneous diseases as their climate produces, by manure.

year, or every other year at furthest, on the counted frequently above ninety grains in a head same land, but I remember to have been in a and once as many as one hundred and two; my neighbour's field during the late war, when he present crop is mostly of Frederick wheat, a new pointed out parts of a clover field, which had been planted three years before-the crops on that part was green and fine, the balance of the field was not worth cutting, though it was evidently the fly

QUESTIONS ON WHEAT.

Q. What is the best time for sowing wheat in order to escape the ravages of the Hessian Fly?

A. I have never sowed any wheat earlier than 20th of September but once, and then from 22 or lieving the wheat will be as good and better if 23 acres, sowed between the 10th and 20th of the manure is not fine, and am sure the land is best with what I sow from the 25th September in, than if it was left on the top of the land to the 8th or 10th of October.

Q. What is the best mode of sowing it, and how

much seed is necessary to the acre?

A. I sow broad cast and not more than one profitable on a large scale of farming.

Q. What is the best and most successful pre-

A. I have used no preparation to avoid smut, believing it was either contagious or an hereditaor balls in some lawler wheat in the crop of 1819, I determined to get wheat elsewhere for seed ears, his wheat sowed after the 15th of October

Q. What is considered the most fertilizing step. to hasten and strengthen the growth of wheat?

A. To this I can give no particular answer. Q. Is pasturing the wheat by sheep in the fall, considered as advantageous in destroying or lessening the destructive effects of the hessian fly?

A. I believe that pasturing wheat is not beneficial but injurious, leaving it more liable to injury

by the fly

Q. Which do you consider the most productive T. CRAMER, Secretary way of raising wheat-on clover lay, or clear

for a crop if broken up in good time, i. e. in August, though I have made more wheat to the acre after corn than on other land.

in wheat, and which do you consider the best practice coeval with mankind.

than the Egyptians; and few nations so passion ately fond of bathing.

Though the ancients could less dispense with

the use of the bath, on account of the frequency the basis of cleanliness, bathing in its different forms, may be pronounced one of the most extensive and beneficial restorers of health and vigour.

Cold, Cool, Warm and Hot Baths. Cold Baths are those of a temperature varying from the 33d to the 56th degree of Farenheit's thermometer. The general properties of the cold bath consist in its power of contracting the animal fibres, while it dissipates the caloric (or of the particles, which were before dilated and relaxed by heat. That such is the natural influence of cold, cannot be doubted; and hence this species of bath, by its powerful action on the whole system, is one of the most important ure.

rendered the use of such a remedy inestimable.

its efficacy. For this obvious reason, it is peculis more safe, according to my experience, than liarly adapted to those constitutions which, though the cold bath. This is so true, that I have, for robust, and apparently healthy, are liable to tic affections, as well as to frequent attacks of flatulency, and consequent indigestion.

Without expatiating either on the history or the sensible effects of the Cold Bath, we shall

which it cannot be resorted to with advantage and safety.

II. To lav down the necessary rules and direc-

tions for this heroic remedy.

With respect to the former, we must be concise, and shall chiefly point out, by negative pro positions, those particular states of the body, in which cold bathing must not be attempted; name-ly, 1. In a full habit of body, or what is called general plethora, on account of the frequent fe brile disposition attending such individuals. 2. exercise to a violent degree, are proper on this brile disposition attending such individuals, 2. exercise In hemorrhages or fluxes of blood, open wounds occasion. or ulcers, and every kind of inflammation, whethrespiration, short and dry coughs, &c. 5. When may continue much longer in it than valetudinate the whole mass of the fluids appears to be vitiatians; and both will be influenced by the tempeter of the air, so that in summer they can encaunot be easily defined, but is obvious from a joy it for an hour, when, in spring or autumn, one flesh when cut or bruised, and from a scorbutic tendency of the whole body. 6. In gouty and returned to the whole body. 6. In gouty and returned to the whole body. 6. In gouty and corpulent: hence the former, even in the asserts, that "Podagries sometimes have kept hottest days of summer, can seldom with safety single drops, it is more stimulating and pleasant.

which tend to promote a critical discharge of hour, while the latter are generally able to sustain our by the pores (yet the celebrated physitain its impressions for double that time. humours by the pores (yet the celebrated physician just mentioned, informs us, that great cures of their athletic exercises, as well as from the want of linen, which was then much less in use than at present, yet, in our times, it would be of great service if the use of baths were more geformed state of the body, except in particular water. neral and frequent, and this beneficial practice cases to be ascertained by professional men.—Sir of the immersion will be less felt when it not confined to particular places or seasons, as a John farther recommends, but too indiscriminate is effected suddenly; and as it is of consequence mere matter of fashion. Considered as a species by, the dipping of ricketty children one year old, that the first impression should be uniform over of universal domestic remedy, as one which forms every morning in cold water; and he is of opinion that, in adults, it prevents the infection of fevers, by making the body less sensible of the changes of air; that, in old women, it stops vio-lent hemorrhages from the uteris; that it has contributed to cure canine madness, poisonous of apoplexy. For these reasons, the shower bites of animals, and obstinate agues, by going in bath is attended with considerable advantages, previously to the return of the fit, and after all because it transmits the water quickly over the the evacuations of the body have been properly attended to; and lastly, that the Sea-water Bath matter of heat) that exists between their inter- has been of eminent service in dropsies and destices, and thus effects a greater approximation fective hearing; in which last case, he knew a deaf person, who could hear perfectly well on the day he bathed in the sea.

Experience, however, has but too often evinced, that this excellent remedy, whether by fresh rays of the sun, and the immersion will not inter-or salt-water, cannot be implicitly relied upon in fere with digestion: on the whole one hour after medicinal remedies presented by the hand, and, those complaints; nor will it be productive of as it were, supplied by the very bosom of Na- any good effects, unless our conduct in general, any good effects, unless our conduct in general, be accommodated to the following rules:

Even in the most remote times, cold bathing was 1. It is a vulgar error, that it is safer to enter resorted to with obvious advantage, by nervous the water when the body is cool, and that persons and debilitated persons; but in the dark or mid-heated by exercise and beginning to perspire, dle ages, this genuine source of health was total-should wait till they are perfectly cooled. Thus, ly neglected, till the good sense of Europeans by plunging into it in this state, an alarming and again adopted it as a general restorative, when dangerous chillness frequently seizes them, and the prevailing diseases of relaxation and atony the injury sustained is generally ascribed to their going into it too warm; while it doubtless arises The superior advantages of cold bathing over all internal corroborants, consists chiefly in its immediate salutary action on the solids, without the intervention of the organs of digestion and precision, that "in the earliest stages of exercise, it will be necessary for him, with the assistance nutrition; without having to perform a passage before profuse perspiration has dissipated the heat, of another person for dispatch, to wipe and dry through numerous channels, before it can exert and fatigue, debilitated the living power, nothing his body with a coarse and clean cloth. He should some years, constantly directed infirm persons to nervous, hysteric, hypochondriacal, and paraly use such a degree of exercise, before immersion, as may produce some increased action of the vascular system, with some increase of heat, and thus secure a force of re-action under the shock, which otherwise might not always take place. But, though it be perfectly safe to go into the I. To a general enumeration of those cases in cold bath in the earlier stages of exercise, nothing thich it cannot be resorted to with advantage is more dangerous than this practice, after exercise has produced profuse perspiration, and ter-minated in languor and fatigue; because in such circumstances, the heat is not only sinking rapid-

2. The duration of every cold bathing applied er external or internal. 3. In obstructions of the to the whole body, ought to be short, and must be intestines, or habitual costiveness. 4. In affections of the breast and lungs, such as difficult sensations of the individual; for healthy persons Hence respiration, short and dry coughs, &c. 5. When may continue much longer in it than valetudina-

their fits off with it." 7. In cutaneous eruptions, remain in the bath longer than a quarter of an

3. The head should first come in contact with

the body, we must not enter the bath slowly or timorously, but with a degree of boldness. A contrary method would be dangerous; as it might propel the blood from the lower to the upper parts of the body, and thus occasion a fit because it transmits the water quickly over the whole body; and, consequently, is more consistent with the rules before-mentioned.

5. The morning is the most proper time for using the cold bath, unless it be in a river; in which case the afternoon, or from one to two hours before sunset, will be more eligible; as the water has then acquired additional warmth from the rays of the sun, and the immersion will not intera light breakfast, -or two hours before, or four hours after dinner, are the best periods of the day for this purpose.

6. While the bather is in the water, he should not remain inactive, but apply brisk general friction, and move his arms and legs, to promote the circulation of the fluids from the heart to the extremities. It would, therefore, be extremely imprudent to continue in the water till a second chillness attacks the body; a circumstance which would not only defeat the whole purpose intend-

not afterwards sit inactive, or enter a carriage, unless warmly clothed and wearing flannel next the skin; if season and circumstances permit, it will be more proper, and highly beneficial to take gentle exercise till the equilibrium of the circulation be restored, and the vessels, as well as the muscles, have acquired a due degree of re-ac-

The best place for cold bathing is in the invi-gorating water of the sea, or a clear river; and where neither of these can be conveniently resorted to, we recommend the Shower Bath. Its effects are doubtless more powerful than those of the common bath: and though the latter covers ly, but the system parts more easily with the the surface of the body more uniformly, yet this portion that remains." In short, it is a rule liable circumstance by no means detracts from the exto no exception, that moderate exercise ought cellence of the former: because those intermediate parts, which the water has not touched, receive an electric and sympathetic impression, in a degree similar to those brought into actual contact. As every drop of water from the shower bath operates as a partial cold bath, its vivifying shock to robust individuals is more extensive and beneficial than from any other method of

Hence this bath is possessed of the following important advantages: 1. The sudden contact of the water may be repeated, prolonged, and modified at pleasure. 2. The head and breast

DRAly, or

veluaelightneness tant of ew to r such

es, by mpure sensiearth plaints than the usual immersion, and can be more readily procured and adapted to circumstances. And, 4. The degree of pressure from the weight of water is here, likewise, in a great measure pre- may be relieved, and sometimes cured; while vented; nor is the circulation of the fluids interrupted so as to render the use of this bath in by wantonly sporting with so powerful an alteany degree dangerous, -a circumstance of the rative of the animal machine, either from sick highest importance, because, by the ordinary immersion, persons are often exposed to injuries which they least apprehend.

Cool Baths may be called those which are of a temperature between the 56th and 76th degrees of Fahrenheit's scale. They are of great service in all cases where cold bathing has before been recommended, and require nearly similar precautions. As their influence, however, on first entering them is less violent, though their subsequent effect may be attended with equal advantages, it follows, that even persons of a more de-

licate organization may resort to them with greater safety.

With respect to rules for cool bathing, we refer the reader to those stated in the preceding article; and shall only remark, that notwithstanding its effects are less perceptible while the body continues in the water, it is necessary that the bather, on coming out of it, should be wiped dred per cent.—Dr. W. Barton has recommend-dry with the greatest expedition, to prevent ed the seed of the H. Bicolor, as a substitute catarrhal affections.

above the 76th, and not exceeding the 96th or for poultry, it deserves the attention of rural 98th degree of the thermometer before mention- economists—especially in the Southern States, ed. There are various springs in Britain, espe- whose climate is so congenial to its native place.

There are various springs in Britain, especially those of Bath, Clifton, Buxton, and Matlock, to which Nature has given this tempera- sent to you, with a letter dated, Edisto Island, ture, the most beneficial to the human body. May 11, 1824, under the name of French millet, But whether the tepid bath of this description or Egyptian Millet, is a variety of the Holcus be natural or artificial, it is equally conducive to spicatus, mentioned in the communication already the restoration of energy, though its effects alhuded to—(4 varieties are known.)—Abundant have, till lately, been little understood. Physic information respecting this plant may be found cians as well as patients, have hitherto been too in the Dictionnaire Encyclopedique of La Marck, generally accustomed to consider a warm bath

—Art. Houque. This plant goes among the as weakening the body, and useful only for the French by the names of couscou, millet à chanremoval of certain diseases, especially those of delle, &c. the skin. Experience, however, has amply proved, that there can be no safer and more effieacious remedy, in a variety of chronic or inveterate complaints, than the warm bath, if proper- our country, for an easy reference—and most of ly used, and continued for a sufficient length of them, too, are written in Latin. Although I have time. Instead of heating the human body as has erroneously been asserted, it has a cooling ness of the pulse, and reduces the pulsations in a remarkable degree, according to the length of time the patient continues in the water. After the body has been overheated by fatigue from travelling, violent exercise, or from whatever cause, and likewise after great exertion or per-turbation of mind, a tepid bath is excellently calculated to invigorate the whole system, while it allays those tempestuous aud irregular motions, which atherwise prey upon, and at length reduce, the constitution to a sick-bed. Its softening and assuasive power greatly tends to promote the growth of the body; on which account it is pe-culiarly adapted to the state of such youth as manifest a premature disposition to arrive at a settled period of growth; and it has uniformly MR. SKINNER, been observed to produce this singular effect in Permit me the all climates

medical advice.

Dr. Oliver asserts, "that by the prudent use of the hot bath, most chronical disorders, and gouty cases in particular, not in an inflamed state persons in high health may be greatly injured ness to health, or from health to sickness.

Tegg's Book of Utility.

TO THE EDITOR OF THE AMERICAN FARMER.

Baltimore College, May 29, 1824.

DEAR SIR,

The plant of which the seed has been sent to you from Alabama, by Col. Pickens, is the Holcus bicolor, to which I alluded in my communication species of Holcus may be considered as a variety of the Holcus sorghum. There are strong rea-sons for this suggestion. The French call the H. sorghum, Grand Millet.—Among us, the use of wheat and Indian Corn, renders this plant less paration I found it extremely difficult to raise any valuable than it is in Africa. valuable than it is in Africa and Arabia, where Niehbur tells us that its seed yields two huned the seed of the H. Bicolor, as a substitute for chocolate or coffee, when parched.-At any Warm Baths, are such as have a temperature rate, as a forage, and as supplying abundant food

The other plant, of which an ear has been

These few indications will be sufficient as an Index or Key for your correspondents. Unfortunately botanical works are not enough diffused through a particular, I might say, a professional fondness for the Greek, Latin, &c. languages, and know well effect, inasmuch as it obviously abates the quick- that the Latin language affords to the learned of all countries, an easy medium for a prompt interchange of ideas, discoveries, &c .- still in this country, where useful knowledge has a wider spread, and seems to seek its level, I hope to see, at no distant day, the Botanical science brought home, as it were, to every farmer's ready apprehension, by the use of the Vernacular idiom.

I salute you with great esteem and respect, L. H. GIRARDIN.

FOR THE AMERICAN FARMER.

BEST FOOD FOR YOUNG TURKIES.

Permit me through the medium of the "Farmer," to present my grateful acknowledgements to cipal food at once out of the earth to their mouths, Hot Baths are those which have a temperature my Cousin Tabitha, far her instructions on the by eating without the necessity of any imple-Hot Baths are those which have a temperature my Cousin Tabitha, far her instructions on the by eating without the necessity of any impleabove 98 or 100 degrees of Fahrenheit, and are subject of preventing the gapes in young turkies ments other than the hands and the teeth, and by occasionally increased to 110 or 120 degrees, and chickens Nodisease perhaps, is more destruc dispensing with every thing requiring skill in the and upwards, according to the particular nature tive to those species of poultry. My Cousin's preparation of the food and cleanliness in its of the case, and the constitution of the patient, philosophy, doubtless, is sound, as to the nature consumption or preservation; leaving these out There can be no stated rules laid down for its use, of the disease; for not being a professional ana- of the question, though they are all matters of as every thing depends upon the peculiar circum-tomist, I am not disposed to controvert the opi-great moment, when we consider their effects in stances of each patient. No prudent person will, nions of those more scientific than myself. I am the rearing of a family, we shall find, that, in we trust, have recourse to a hot bath without no theorist, but for my practical knowledge in mere quantity of food; that is to say, of nourishmatters of domestic concern, am indebted to per- ment, bread is the preferable diet.

sonal observation and the experience of others. As our progress towards perfection in the im-provement of domestic comforts and conveniences is greatly accelerated by taking advantage of the discoveries of those who are well versed in such matters, perhaps it may not appear presumptive in me to suggest to our cousin, and your other readers, a mode of preparing food for young turkies, which, for a long time I have successfully adopted, and which re ommends itself by its simplicity. Two eggs boiled to hardness, cut fine; a handful of young mustard, also cut fine; Indian meal scalded in boiling water, all mixed together with a small quantity of ground pepper, are sufficient to feed at one time one hundred young turkies, to be increased in quantity as they increase in size, until five or six weeks old. They are very fond of this mixture. Eggs that remain after the setting hens are supplied, though unfit for of the 17th current. La Marck thinks that this other purposes, answer this end. Feeding my young turkies on food prepared as above described, I have never known an instauce of one dying

I have usually sown mustard seed at such time as to have it young and tender about the season in which turkies are hatched. Perhaps it may not be a useless hint, that many poulterers permit the gentleman of the gang to acquire too long a beard. Eight females with one male, a year

MAKING BREAD.

77. Little time need he spent in dwelling on the necessity of this article to all families: though on account of the modern custom of using hotatoes to supply the place of bread, it seems necessary to say a few words here on a subject, which, in another work, I have so amply, and I think, so triumphantly discussed. I am the more disposed to revive the subject, for a moment in this place, from having read, in the Evidence recently given before the Agricultural Committee, that many labourers, especially in the West of England, use potatoes instead of bread to a very great extent. And I find, from the same evidence, that it is the custom to allot to labourers "a potato ground" in part payment of their wages! This has a tendency to bring English labourers down to the state of the Irish, whose mode of living, as to food, is but one remove from that of the pig, and

of the ill-fed pig too.

78. I was, in reading the above mentioned Evidence, glad to find, that Mr. EDWARD WAKE-FIELD, the best informed and most candid of all the witnesses, gave it as his opinion, that the increase which had taken place in the cultivation of potatoes was "injurious to the country;" an opinion, which must, I think, be adopted by every one who takes the trouble to reflect a little upon the subject. For, leaving out of the question the slovenly and beastly habits engendered amongst the labouring classes by constantly lifting their prin1,830 lb. of nutricious matter. Now mind, a and potatoes; and, therefore, I shall now probaker's bread. Besides this, rye, and even barbushel of wheat, weighing 60 lb. will make of household bread (that is to say, taking out only the bran) 65 lb. Thus, the acre yields 2080 lb. of bread. As to the expenses, the seed and act wheat; that is to say, where the Winchester wheat; that is to say, where the Winchester between the pound of household bread, than in a pound of household bread. Besides this, rye, and even barbusheld bread baker's bread. Besides this, rye, and even barbusheld bread to induce him to bake his own bread. Very good bread. Few people upon the face of the earth live better than the Long Islanders. Wheat; that is to say, where the Winchester better families out of ten, seldom eat wheaten of planting are about equal in the two cases. But, while the potatoes must have cultivation during their growth, the wheat needs none; and while the wheat straw is worth from three to of flour from the sixty pounds, will make sixty-five bread. Rye is the flour that they principally pounds of bread, besides the leaving of about ten make use of. Now, rye, is seldom more than during their growth, the wheat needs none; and while the wheat straw is worth from three to of flour from which the bran only is taken. If five pounds an acre, the haulm of the potatoes is you make fine flour, you take out pollard, as they rye and half wheat, taking out a little more of not worth one single truss of that straw. Then, as call it, as well as bran, and then you have a smallto the expense of gathering, housing and keeping er quantity of bread and a greater quantity of quarter rye and a quarter barley; nay, one-third the potato crop, it is enormous, besides the risk offal; but, even of this finer bread; bread equal of each make bread that I could be very well of loss by frost, which may be safely taken, on an in fineness to the baker's bread, you get from content to live upon all my lifetime; and, even

For it must be a considerable time before En-lings; and it yields you the weight of thirteen and of poultry of all descriptions. They will also people can be brought to eat potatoes in the and a half quartern loaves. These quartern fatten quicker upon a meal of barley, than upon lish people can be brought to eat potatoes in the land a half quartern loaves. These quartern ratten quicker upon a meal of barley, than upon loaves now sell at Kensington, at the baker's shop the earth with their paws, toss them into a pot without washing, and when boiled, turn them out upon a dirty board, and then sit round that board, peel the skin and dirt from one at a time and eat the inside. Mr. Curwen was delighted with a bushel of bread. The baker's quartern load, "Irish hospitality," because the people there re-is, indeed, cheaper in the country than at Ken-iton with us.—[Cobbett's Cottage Economy.]

t. in risha labourer's family. When wheat is ten shilad to fetch them at a considerable expense. 1 hink, therefore, that I give the advantage to the tatoes, when I say that they sell upon an ave ounds less weight than the bushel of wheat; ings of a labourer in husbandry.

bile they yield only five pounds and a half of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and while the shameful, for a labourer's wife to go to the banded of the tricious matter equal to bread; and tricious matter equal tricious matter equal to bread; and tricious matter equal tricious matter equ

79. An acre of land, that will produce 300 el, you can have sixty-five hounds of bread for ty-nine times out of a hundred, the fuel for heatbushels of potatoes, will produce 32 bushels of the ten shillings; and can have out of potatoes ing the oven costs very little. The hedgers, the wheat. I state this as an average fact, and am only five pounds and a half of nutricious matter copsers, the woodmen of all descriptions, have not at all afraid of being contradicted by any one equal to bread for two shillings! This being the well acquainted with husbandry. The potatoes case, I trust, that we shall soon hear no more of the oven cannot, upon an average, take the Counare supposed to be of a good sort, as it is called, those savings, which the labourer makes by the and the wheat may be supposed to weigh 60 use of potatoes; I hope we shall, in the words pounds a bushel. It is a fact clearly established, that, after the water, the stringly substance, and lazy root," if she choose still to adhere to it. It pounds of bread to the bushel, or nearly another that, after the water, the stringly substance, and lazy root, it she choose still to adhere to it. It pounds of bread to the bushel, or nearly another the earth, are taken from the potato, there resist he root also, of sloveliness, filth, misery, and nutricious matter, or matter which is deemed equally nutricious with bread, and as the raw potatoes weigh 56 lb. a bushel, the acre will yield good, are upon the decline. Englishmen seem to be upon the return to beer and bread, from water in a pound of bread, than in a pound of a pound of bread to the bushel, or nearly another quartern loaf and a half, making nearly fifteen quartern loaves out of the bushel of wheat. The sincest flour is by no means the most wholesome; and, at any rate, there is more nutricious matter in a pound of bread, than in a pound of bread, than in a pound of bread, than in a pound of bread to the bushel, the surface of the papers.

of loss by frost, which may be safely taken, on an average, at a tenth of the crop. Then comes the expense of cooking. The 32 bushels of wheat, supposing a bushel to be baked at a time, (which would be the case in a large family) would demand thirty-two heatings of the oven. Suppose a bushel of potatoes to be cooked every day, in order to supply the place of this bread, then we have nine hundred boilings of the pot; unless to the baker's bread, you get from fifty-eight to fifty-nine pounds out of the bushel of wheat. Now, then, let us see, how many quartern loaves you get out of the bushel of wheat, supposing it to be fine flour, in the first place. You get thirteen quartern loaves and a half, these cost you, at the present average price in order to supply the place of this bread, then we have nine hundred boilings of the pot; unless to the baker's bread, you get from fortent to live upon all my lifetime; and, even barley alone; if the barley be good, and none but the finest flour taken out of it, has in it, measure for measure, ten times the nutrition of powers there are bushel, in the first place. You get thirteen quartern loaves and a half, these cost you, at the present average price of wheat, (seven and sixpence a bushel,) in the first place that is 7s. and 6d.; then 3d. for grinding; being the hot; unless to the baker's bread, you get from fortered barley alone; if the barley be good, and none but the finest flour taken out of it, has in it, measure for measure, ten times the nutrition of powers are the first place. Indeed the fact is well known, that our forefathers used barley bread to a very great extent. Its only fault, with those who dislike it, is not to find with the baker's loaf, which has in it no more of the sweetness of grain than is to be be found in the offal which comes from the saw. Think of the labour; think of the time; think of the labour; think of the baker's boat and the bushel of wheat, supposing it to be fine flour, in the first place is the first place. You get thirteen quartern loa Think of the labour; think of the time; think worth more than a half a pound, while the grindings of deal boards. The nutricious nature of all the peelings and scrapings and washings ing is 9d. a bushel. Thus, then, the bushel of attending these nine hundred boilings of the not! bread of fifty-nine pounds cost you eight shillings; and it yields you the weight of thirteen and of poultry of all descriptions. They will trive no parish relief; upon which I can only sington, by, probably, a penny in the loaf; which may, that I wish him the exclusive benefit of such would still, however, leave a saving of 5s. upon the bushel of bread. But, besides this, pray think 80. I have here spoken of a large quantity of a little of the materials of which the baker's loaf 80. I have here spoken of a large quantity of a little of the materials of which the baker's loat ach of the sorts of food. I will now come to a is composed. The alum, the ground potatoes, emparative view more immediately applicable and other materials, it being a notorious fact, that the bakers, in London, at least have mills, where- DEAR SIR, ngs the bushel, potatoes bought at best hand in to grind their potatoes; so large is the scale am speaking of the country generally,) are upon which they use that material. It is probayear, and have added such notes of the vegetaout two shillings a bushel. Last spring the ble that, out of a bushel of wheat, they make tion in April and May, as my notes afford. erage price of wheat might be six and six- between sixty and seventy pounds of bread, rese were of the coarsest kind, and the farmer yours in quality, you have, allowing a shilling of the wind, I am in hopes our fruit is not destroyed to fetch them at a considerable expense. I for the heating of the oven, a clear 4s. saved uped. Vegetation is at least seven days earlier than ink, therefore, that I give the advantage to the on every bushel of bread. If you consume half last year; and I have had rye in head some days. a bushel a week, that is to say, about a quartern ge, for full a *fifth* part as much as the wheat loaf a day, this is a saving of 51. 4s. a year, ils for, per bushel, while they contain five or full a sixth part, if not a fifth part of the earn-

shel of wheat will yield sixty five hounds of ker's shop; and how negligent, how criminally rad, besides the ten pounds of bran. Hence it careless of the welfare of his family must the la clear, that, instead of that saving, which is bourer be, who permits so scandalous an use of the proceeds of his labour! But I have, hitherto.

Editorial Correspondence.

Albany, May 15.

I inclose a meteorological table for the last

Yesterday we had flurries of snow at intervals though they have no more flour, and, of course, all day, with strong N. W. winds. The thermometricities was about eighteen hence; though no more nutricious matter, than you have in your fifty-nine pounds of bread. But, at the and this morning before sunrise at 31 in the open least, supposing their bread to be as good as air, 1 degree below freezing—and yet, on account

> I have new, and to me sufficient evidence, that liming seed wheat, is a preventive of the fly as well as of smut. The experiments of G. B. Evertson, of Poughkeepsie, and of Col. Mather, of Scaghticoke, both intelligent observing gentle-men, has removed all doubts in their minds. And Gen. Armstrong, as follows:-

"Liming seed to prevent smut and other similar maladies, has been long practised in Europe. I think I notice it in the Practical Farmer; but tatoes, there is a waste of more than one half; taken a view of the matter the least possibly ad whether or no, I have seen it used in this neighbors, then wheat is ten shillings the bush- vantageous to the home-baked bread. For nine-bourhood, on a suggestion of mine, and with the whether or no, I have seen it used in this neigheffect of completely protecting the crop from the of January, eighteen hundred and twenty-four, fly. My son, Col. H. B. Armstrong, was the experimentor-limed one half his wheat seed, and sowed the other half without liming. The for-mer had no fly—the latter was devoured by it," Your's with esteem,

J. BUEL.

Edisto Island, May 11th, 1824.

DEAR SIR, You having kindly furnished the members of our society with various sorts of seeds; I embrace with great pleasure the opportunity I now have, of reciprocating in some measure your friendly offices. I send you herewith an ear of what the seedsman called French millet. It grows with great rapidity. When I saw it last autumn in a small patch of William Seabrook, Esq. the Vice-President of our Society, and who has kindly furnished me with this specimen, it had attained the height of at least 20 feet. It throws out a great number of shoots or suckers, and in the opinion of Mr. Seabrook, will yield a greater quantity of fodder than any other grain or grass with which we, in the southern states, are acquainted—not excepting the Guinea grass. Mr. S. planted it in rows about 5 feet apart, and the same distance between the hills—4 grains in each hill. The rows, or beds, were made by the hoe precisely in the same manner as they are prepared in our southern seaboard districts for Indian corn.

Having mentioned Guinea grass, I shall just in passing, observe that Dr. Auld of our Island, had it growing last year in great luxuriance-its uncommon growth after the second cutting attracted his attention. When upon measuring it he found it had in eight days attained the height of three feet nine inches. The Doctors seed was procured from Jamaica—he took great pains to preserve

A MEMBER of the St. John's, Colleton Agricultural Society.

N. B. It has just occurred to me, and I have no doubt of the fact, that the friends of the soiling an inch or two at the root-end of the straw makes a great addition to the dunghill.

75—Do. Untrimmed, \$5.75—Ginseng, 30 cts.—
Linseed Oil, 62 cts. in demand—Clover Seed, \$3. the French millet. As I have some doubts of the correctness of the name given to this plant, will correctness of the name given to this plant, will pear, that the average produce, in straw, of all the different crops, stubble included, may be called the different crops, stubble included the different crops are crops. tion on the subject.

THE VINE.

The cultivation of the vine begins to attract the attention of many in different parts of the country. Every year new vineyards are planted and old ones are enlarged; good wines, too, are made, which, at moderate prices, afford a handsome profit.

Our attention has been more particularly called to this subject at this time, by seeing a letter from Mr. Eichelberger, of York, Pennsylvania, in which he has been offered two hundred dollars a year her acre, for four acres of his vineyard. This offer was made by a person "who understands the business well, and was brought up to it," and believes that the vines and cuttings from these four acres, at a low price, and with an ordinary crop of grapes, will produce three thousand six hundred and seventy-two dollars.

Is not this well worth the attention of our farmers and planters .- Nat. Jour.

JOHN C. MOORE, Inspector. TREASURY OFFICE, ANNAPOLIS, May 20, 1824. True Copy, from the original report on file in this office.

B. HARWOOD, Tr. W.S. Md.

IMPORTANCE OF STRAW IN HUSBANDRY.

This is a subject that has not hitherto been so much attended to as its importance deserves. Though many useful observations on straw, are occasionally introduced in agricultural writings, and though its value, as the basis of future crops, is fully admitted by every intelligent farmer, yet the subject has seldom been professedly treated of at any length: we shall endeavour, therefore, to compress the most important particulars connected with it, under the following heads:

1. The weight of straw produced on an average of the different crops of grain and pulse, per

statute acre.

2. The value of the different kinds of straw,

3. The various uses to which each kind of straw is applicable.

&c.; 2. The different kinds of the same grain; 3. the roots alive during the last winter, but was not successful. As his plants yielded no seed he has abandoned the cultivation of it.

A MEMBER of the St. John's and, 6. The manner in which the straw is cut, for

From a statement by Mr. Young, it would ap-

It is calculated by Mr. Brown, of Markle, that

on an average of years, the produce of straw in thers, 35 cts. good land, and under tolerable management, will be nearly in the following proportions, per English acre:

		Stones.
Wheat,		160
Beans and	Peas,	130
Oats,		130
Barley,		100

Total 520

lbs. or 1 ton 5 cwt. 2 quarters and 4 lbs.

It may be safely estimated, that on an average of years, well cultivated and fertile soils, when the crop is carefully cut down, will annually produce, on the average of the crops above-mentioned, and taking the average of the kingdom, 1 ton, 5 cwt. per English acre.

Peas-Straw.

In Scotland the haulm of peas is used as fod-der for working-horses, instead of hay; and when well harvested, forms a very excellent provender, insomuch that it is considered to be of almost equal

THE FARMER.

BALTIMORE, FRIDAY, JUNE 4, 1824.

A GREAT CONVENIENCE.-We have heretofore advocated the offering of a premium to the inventor of the best contrivance for transporting fresh butter to market, from any distance, by land or water.—This desirable object has now been accomplished by Mr. Richardson, at his shop in East Street, where he makes and sells, at various prices, from \$10 to \$15, according to size, butter boxes constructed on the principle, and somewhat on the plan of his excellent Refrigera tors, some of which on the most improved plan are now for sale.

These Butter boxes are so compactly arranged, as, with a small quantity of ice, to bring the butter to market in the best condition, and without injury to the form of the prints.—Where boxes are bespoke, the diameter of the print in use, ought to be given.

Every new facility of this sort, while it enables farmers more distant, to avail themselves of the benefit of the market, at the same time increases competition, and reduces the cost to the consumer of the article-and is therefore an object

of publick utility.

It is said that corns on the toes may be readily cured by rubbing them with pummice stone.

PRICES OF COUNTRY PRODUCE—carefully collected every Thursday, for the American Farmer. By ROGERS & SYMINGTON.

Weight of Straw produced by the different Crops.

The quantity of straw per acre, differs according to a variety of circumstances; as, 1. The \$2 25 to \$3—Corn Meal, pr. bbl. \$2—Wheat, species of grain, whether wheat, barley, oats, white, \$1 18 to \$1 20-Ditto Red, \$1 14 to \$1 16 -Corn, yellow, 33 cts.-Ditto, white, 30 centsstraw is more abundant than in poor ones; 5. The season when the seed is sown, for spring-sown wheat has less straw than the winter-sown; and, 6. The manner in which the straw is cut, for Do. Do. No. 2, S1 25—Shad, trimmed, \$6 50 to \$3 75 per bush -Flax Seed, rough, 75 the different crops, stubble included, may be cal-culated at 1 ton 7 cwt. per English acre; but that is rejecting the weaker soils.

It is calculated by Mr. Brown, of Markle, that

It is calculated by Mr. Brown, of Markle, that

TOBACCO.-Actual sales-Joshua Hood, of Bal timore county, 1 hhd. yellow tobacco, \$22 per cwt.

AGRICULTURE.

meeting on 12th April, 1824, by Thomas G. less indeed it be WATKINS, M. D. President of the Society.

(Concluded from No. 11.)

Whoever expe

Gentlemen of the Agricultural Society,

5. The kind of grains, grasses, &c. to be pre-pared.— It is not only highly important to an im-

lity of the soil, and to stimulate the growth of all vegetable products—manures are indispensible. They are to be obtained from animal, vegetable, or fossil substances, from air, water, and we may add from almost every thing else; and the judicious preparation and application of them, constitutes of itself a highly important branch of the science of agriculture, and the art of good pendence, or monarchise the republican simplifications and credit—overdealing makes us the husbandry; few districts of country are more favoured, for the facilities afforded of obtaining manures than East Tennessee; good range for the deep and extensively laid plans of all the soil to stimulate the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the virtuous hopes ed with much ability in Baltimore,—and the works as soon as our means will admit—but beyond these, I will never advise the expenditure of one these, I will never advise the expenditure of one these, I will never advise the expenditure of one these, I will never advise the expenditure of one these, I will never advise the expenditure of one these, I will never advise the expenditure of the sense of the husbandry in the sense of the husbandry in the sense of the h stock, and other resources for animal support, af legitimate monarchs of Europe and the world, and political happiness—painful diseases are ford the means of supplies from this source—and the means of accomplishing their objects, thereby prevented—or if natural causes only promountain air and innumerable streams of water, have never been wanting among us—and perhaps duce these, they are more uniform in character limestone and wood to burn it, provided at every ever means or pretexts therefore, money can be and fickle course of subsistence—new, unknown, farmer's door, a most valuable and inexhaustible withdrawn from us—our power is diminished, and unheard of diseases arise amongst us, and resource in this never sufficiently estimated fossil; and theirs comparatively enlarged. Robbed of doctors and old women are kept squabbling about

we are told, is inexhaustible; with such fortunate selves—by pursuing the wisdom of our fathers, resources, gentlemen, what more is requisite, to Let our ways be frugal, plain and rational. One

2. The animals to be maintained upon our land. These consist of such as are used for labour in cultivation, or for subsistence and market: and for either of these objects, too much attention cannot be paid to selection and keeping. Hither to perhaps, it has been a material error in our husbandry that, oxen have been too much post-poned for horses in our plantation operations.—They are equally docile, more hardy, easier kept—and when no longer useful for labour, afford us excellent food—and the remark we have frequently heard made, that a reduced ox quickly stabled, makes the tenderest beef, is worthy of some consideration—mules too are too much neglected amongst us. Whatever may be our choice of animals and breeds, and for whatever purposes, economy requires that all animals should be properly secured from inclement weather, and well fed. 2. The animals to be maintained upon our land. by the arts of agriculture; let him not become or restoration of their bloated monarchy, are more well fed.

3. The gear and implements of husbandry.—
Without these our land and animals would profit fore, the surest foundation of public spirit in all, a public point of view, what tends to undermine es little; a plenty of them, and the best kind will to aid our operations, and favour our upright the plainness and purity of our manners, must be found the cheapest in the end, in a few years views—and if prejudice or partiality might with deeply affect us, as it should them—confining our a farmer will consume unprofitably, more time in propriety in any case be sued—could it be done attention to the more modest pursuit of what is running backwards and forwards with a single in any better earthly cause? We have heard useful and comfortable, we should leave the noplough to a blacksmith's shop, than would be suf much of late about prodigals and radicals. Now ble, the elegant and the splendid-to the wild

objects, instead of rendering all the elements tri prodigal of our own labour, that we may radi-never sanction the introduction of mahogany butary to his support, permits them to depredate cally remove all the weeds and trash, that would sideboards, and bureaus, and richly papered upon his substance, and carry off a great portion swallow up or dissipate the substance of our walls, in a country remote from seaboards, and of his profits.

I cannot conclude my remarks, where our own native cherry, walnut, sycamore, 5. The kind of grains, grasses, &c. to be prefured.— It is not only highly important to an improved state of agriculture, and agricultural pro

206 PAPERS

Read at the last meeting of the Agricultural Society of the Valley, and by order of said Society, communicated for publication in the American Farmer.

No. V. Springfield, October 15, 1823.

Having already declared myself to the Secra tary as a candidate for one of the first and most award, I have thought that in addition to a restock, implements of husbandry, and general assome cursory remarks on each item to which

1st. In relation to Yards and Manures. To insure prosperity to the farmer who is unwilling to turn much of his attention to the creand properly within our means. The first set-lation and preservation of manure by its proper tlers of the good old Virginia, as was once call-application to the soil, would be as preposterous as to insure the success of the merchant, who, ments in America-far removed from the cor-though receiving his store room filled with goods, ruptions of despotism-felt and cherished only having himself provided with every implement the natural social virtues, and heartfelt unobtru- of his profession, and his counters surrounded by sive piety. The sons of these were our fathers purchasers, failed to replenish his shelves with of the revolution. All had a plenty, and could articles to supply their demands. For though give their neighbours some. Debts, executions, we may receive our lands in the richest state, be and embarrasments, chased not joy and comfort possessed of the best improved implements of away from their happy habitations. But design the husbandman, deposite our seeds in the ing, corrupting, misleading fashion, with her handsomest manner, at present reap the most hundred follies and vices, paraded herself into abundant crop—yet if we fail to return to the these republican walks where unpretending hos- soil nourishment in the aggregate, amounting to pitality had reigned, with not less dignity for that drawn from it by cultivation, our lands being plain and simple. And there are not want- must be impoverished, and our posterity (if not ourselves) have their eyes opened to the system stilendour, of this same Atlantic, thousands and of bad management which we have pursued. It ten thousands, of virtuous, intelligent, dignified is indeed astonishing that when the benefit of individuals, who cast their long and lingering manure is so evident and immediate, its effects looks back upon the past, while they are forced so fully compensating the farmer for his labour in along, sighing as they sink in the current that applying it, that it should be so totally neglected by many even among our best cultivators.

In offering an opinion as to the proper time hearts, and disturb our convenience, or plunge contact; and believing too, that the process is land, I do not include in my rotation: A porus into embarrassments—no capitaled creditors greatly accelerated by the order passing from tion of this is taken (depending upon the quantity

cattle already in a fermenting state, I contend that the manure taken from the yard as soon as a decomposition had perfectly commenced is much nore efficacious than the same would be if applied in a dry state. There is, perhaps, no point on which opinion more equally turns than on this, it has divided two of the most learned and agacious agriculturists in the union; I allude to ladge Peters of Pennsylvania, and Col. Taylor of Virginia. The former, however, after having nade the fairest experiments the case would admit of, feels from the result more fully confirmed in the opinion which he has ever entertained (to wit, that of applying it in its partially fermented state). He mentions as another great advantage of hauling all matter first to the barn yard, and one too, that must be obvious to every farmer; that of saving the urine of our cattle, which otherwise for the want of an absorbant would be lost. The best constructed barn yards that I have seen were the concave ones of some of our northern farmers, in which all the fluid matter runs to the centre, and is absorbed by frequent applications of earth, straw, weeds, corn stalks, &c. It is the opinion of those who have made the experiment that by proper management we subversive of heartfelt happiness and personal view of my fences and divisions, orchard, live can make fifteen wagon loads of manure from each head of our stock.

2d. Fences and General Divisions.

It is unnecessary to say much about fencing; the kind that would be cheapest and best in one part of our country, might, in all probability, be more costly in another. To those who are situated near saw mills, and where timber is abundant, the board fence I would suppose cheapest. Five plank six inches broad, and sixteen and a half feet long, with two locust posts, makes a rood of durable fence that will not cost in all (including the white washing which is usually recommended as a great preservative of the plank) above seventy-five cents. Where plank is scarce, and stone abundant, the latter might be preferable. Indeed on our large farms it is advisable to have both. I have no doubt, however, that either are cheaper (without estimating the cost of timber for rails) than to cut, maul, make up, and annually repair a common worm fence, the produce of the ground saved by stone or board would repair the fences for a generation. Under the head of rotation of crops something will be said on general divisions.

3d. Rotation of Crops.

As nature has pointed out the propriety of not confining the digestive powers of the stomach too long to any single species of food, by supplying a variety of fruits and vegetables in every season of the year, and some peculiar to each; so has she suggested to the Husbandman the advantages of a change of seed which he furnishes to the grounds. We demand no better evidence of this than the fact, that cutting frequently from our lands scrubby pines, and fine growth of oak succeeds, or perhaps by destroythree years, decaying, and nourishing some new species which had never grown before on the same ground, goes to illustrate the same truth. The great advantages of a change to be seen wherever it is practised, should, however, be sufficient to convince us that we were but aiding nature in the accomplishment of her wishes.

I have seven fields which are employed in alternate cultivation. In addition to this, I have about eighty acres which I consider as meadow which at the time may require re-setting in grass) whenever my poorer shifts come in cultivation, thus equallizing the annual crops. The following rotation I have laid down for myself. The seven fields are numbered from one up to seven. Beginning with No. 1, I have it in corn, then wheat, then clover two years, then wheat, then orchard grass, and timothy two years. Again (which will be the eighth year) in corn, so on through the whole number of fields. To make it plain I annex a diagram. On the different fields as designated by the numbers, are to be seen the crops now growing: on the left, the years for a complete rotation; opposite each year, and under each number of the crop, for the year is mentioned.

	No. 1.	2.	3.	4.	5.	6.	7. field.
1823	Corn.	and	or Grass and Timothy		Clover.	Clover.	Wheat.
1824	Wheat.	Corn.	and	Or Grass and Timothy	Wheat.	Clover.	Clover.
1825	Clover.	Wheat.	Corn.	and	Or Grass and Timothy	Wheat.	Clover.
1820	Clover.	Clover.	Wheat.	Corn.	Or Grass and Timothy	Or Grass and Timothy	Wheat.
1827	Wheat.	Clover.	Clover.	Wheat.	Corn.	and	Or Grass and Timothy
1828	Or Grass and Timo by		Clover.	Clover.	Wheat.	Corn.	Or Grass and Timothy
1829	Or Grass and Timothy	and	Wheat.	Clover,	Clover.	Wheat.	Corn.

Thus it will be seen that in 1823, No. 1 is in corn, No. 2 and 3 in orchard grass and timothy, No. 4 and 7 in wheat, and 5 and 6 in clover; so that every year there is one field (fields averaging forty acres) in corn, two in orchard grass and timothy, two in wheat, and two in clover. All the manure made after the first of April each year, is hauled out during the following October, spread upon the ground, and immediately turned under with three horse ploughs as deep as possible: that made after the 1st of November, and until the first of April, is hauled in the month of March and spread upon the surface of the ground which had been ploughed in the fall, (but not over the portion of the field which had previously been manured) and stirred in with single horse shovel ploughs. In this way all the manure I can make is applied to my corn, which is the crop most requiring it. As soon after ploughing with shovels as possible, provided the middle of April has arrived, I plant my corn and commence the first of May breaking up a clover field, which is then about blooming for wheat. It is broken up in lands of forty eight feet, so that when the field is done, it will be divided by the back lapping and finishing furrow into twenty-four feet lands, by which the seedsman will be guided. The first of June this is all sowed in oats (one and a half bushels per acre) and har-rowed in the direction of the ploughing. The first of August I start my ploughs in opposite directions from that in which it was originally broken. To these ploughs chains are attached which enables them effectually to turn under the oats, of whatever height it may be. I must here state, that to Mr. Isaac Chrisman, one of our most industrious and successful farmers, I am indebted for information as to the proper manner of fixing this chain. I formerly had it attached to the left end of the single tree of the left horse, and the right end of the single tree of the right horse;

fixing it. By Mr. Chrisman's directions, it is my ploughs, harrows, &c. it is unnecessary to attached to the left end of the single tree of the enter into a description of their form. right horse, brought under the beam of the plough just in front of the coulter, carried over and knocked on top of the coulter; this should drag on the ground, when it effectually answers the object for which it is intended.—After my oats is all turned under, I have the field immediately well harrowed the way it was ploughed, and the middle of September, start a harrow in generally getting it under the fetlock, so as to the opposite direction ahead of the seedsman, bruise, wound, or excoriate the pastern. In se-If I cultivate rye, it is only when a portion of my poulticed at first; and when the inflamation has addition to my regular approach. addition to my regular crops. You will perceive with some astringent lotion, as a solution of sugar from what I have said, my corn ground has invariably two ploughings and two harrowings .- I the following liniment may be applied: sometimes give it an additional harrowing-my wheat ground has three ploughings and three harrowings, sometimes a rolling in addition. The Let them be well shaken. field which I annually sow in clover, is the wheat In slight injuries, the astringent lotion, will gefollowing corn; on this the pug from my crop nerally be sufficient for the cure. is sowed, and white clear seed may be necessary. The fallow field of wheat is sowed with orchard ally tight about the body, he is said to be hide-bound; the coat at the same time generally appears rough and dry. This tightness of the skin Upon the forty acre field of oats I turned under pears rough and dry. This tightness of the skin this year, I sowed fifty-five bushels of wheat, is often the effect of hard work and want of sufweighing sixty pound per bushel, twenty two and a fourth bushels of orchard grass, and twen-lingering diseases, and must therefore be consity-two gallons of timothy seed, making one and dered rather as a symptom of disease than as a three eighths of a bushel of wheat and three-disease itself. The best remedies are a light eighths of a bushel of grass seed.

4th Orchard.

My orchard (consisting of two hundred and fifty trees) is composed of a variety of fruit, some of a very choice kind. I last spring, governed by the advice of some of my northern acquaintances, rotation with the field to which it is attached except as to the corn crop, that year an additional skin will soon become loose and glossy again. crop of grass is taken from it. I believe the ploughing occasionally orchard land is of great with more ease for nourishment.

SWINE.

SIR.

The swine or hog is a valuable and useful animal, and a number of them is almost as necessary for the farmer as a stock of cattle. Hogs are not only valuable on account of the meat and fat they afford for the market and home consumption, but highly useful in the business of making manure. It is an indisputable fact, that by proper care and attention, a greater quantity of good manure can be made from swine than in any other way with the same expense.

Much exertion has been made within a few years to make our hogs better, by introducing new kinds and crossing different breeds; and in corn. some instances they have been essentially improved, but in others wretchedly depreciated.

A kind have lately been introduced into this point to any that I have had before them. I can as they will eat; and in this way I can make as with the same expense make one of my old sort good pork as any of my neighbors. weigh at least one hundred pounds more than one of the new kind, so that upon a moderate calculation there is a loss of not less than five dollars in each hog of the English breed.

Much credit is due to the committee on swine at our last cattle show on account of their decision between the competitors for premiums .-The gentlemen composing this committee are the most proper time to check its career. This extirpating the borer recommended. How far well known to be practical farmers, and well quamay be very easily and at the same time, effectuary of them may prove successful we cannot say

bation of them, and their preference to a larger or if more convenient, his whole hand, and in an kind as being better and much more profitable. instant crush their little commonwealth to atoms I am determined to be rid of them as soon as practicable, and for time to come be contented with my old sort until I have better evidence than I had before that a new kind is preferable.

Swine must have suitable food and enough of it, together with good care and attention in order should feel confident of getting rid of them in that they may do well and be profitable. They toto, if my orchards were not in the neighbourshould always be attended by the same person, for if one takes the whole care of them, he will better know what they most need and how much

to give them. They should never have any more trees this season, but I presume it is that pest given them at a time, than they will readily eat called the 'borer.' Its depredations are genewith a good relish, for if they have more than rally committed in the main trunk of the tree, this it will cause them to become dainty, and lose at from eighteen inches to four feet from the their appetite, so that frequently they will eat but ground. Observing the trees to look sickly I was little more than enough to keep them alive.

time been fed upon good meal, will not at any

The period for opening this institution being ultimately fixed for the first day of February next, some previous information respecting it may be acceptable to the public, and useful to individuals who may have views of availing themselves of its benefits; and our press being on the spot as it were, it seems incumbent on us particularly to give that information, which we shall do from the best sources accessible to us, and such, we believe, as are to be relied on. One hundred and nine dormitories are in readiness, conceive what benefit "a sod of earth" can be, sufficient each for two students, for their lodging in preventing its future operations.

W. sufficient each for two students, for their lodging and studies. Six hotels are provided, which will be rented to respectable house keepers, who will furnish the ordinary meals to such students as choose to engage with them respectively, not exceeding fifty in a mess. With this article the University will have no concern, except to reaccommodations, provided at the University, the town of Charlottesville, one mile distant, can lodge and board between one and two hundred students.-The professors will be in place in the course of the autumn, and in time to prepare which has greatly injured my young peach dents who propose to enter for the year ensuing,

. This statement gives a view of the subject very different from that to which we have been accustomed. We have been told by experienced agriculturists that the breed of swine, originally introduced into this country from England, and which had its origin we believe, from the celebrated Bakewell, has proved a great benefit to agriculturists. That very correct and scientific cultivator, Dr. Fiske, of Worcester, stated (in a piece originally hublished in the Worcester Spy, and republished in the New England Farmer, Vol. 1. page 107,) as follows:—" My hogs are of the genuine Bedford breed so called in England, and experience has hroved to my satisfaction, that this breed is far the best that has been introduced into this country.— net prove of any use against cotonille. tittle expense or trouble. I have had some weigh cious against canker worms. at 12 months, about 340 lbs.; and a considerable number, at 18 months old, 400 lbs."

It is possible, however, that the breed, originally excellent, may have deteriorated for want of crossing. "Breeding in and in" as it is technically called, will, in time ruin any breed. Editor N. E. Far.

All applications are then to be addressed to the Proctor of the University, Arthur S. Brockenbrough, Esq. who alone will answer letters on these subjects. We regret to add that the liberal donation of \$50,000, made by the late Legislature, for the purchase of a Library and Apparatus, rested on a contingency which fails, and that the institution will be opened under this disadvantage.

The process of labour. To she is really valuable; she is entitled to good wages, and to consideration and respect into the bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these bargain; but if she be wholly deficient in these the result with great pleasures and advantages. It is attended, in wages, and to consideration and respect into the result with great pleasures and advantages. It is attended, in wages, and to consideration and respect into the sex at the liberal donation of \$50,000, made by the result with great pleasures and advantages. Bargain; but if she be wholly deficient in these the result with great pleasures and advantages. It is a voluntary and advantages. Bargain; but if she be wholly deficient in these the result with great pleasures and advantages. Bargain; but if she be will be bargain; but if she be will as even the result with great pleasures, and to consideration and to consid be such, that such a man's earnings be sufficient lation. Any one as well as she can take in a loaf to maintain himself and family with food, rai- from the baker, or a barrel of beer from the ment and lodging needful for them; such man brewer. She has nothing whereby to bind her has no reason to complain, and no labouring man employer to her. To sweep a room any thing has reason to complain, if the numerousness of is capable of that has got two hands. In short,

find, that the parents themselves have been brought up in the same way. But a conside ration which ought of itself to be sufficient, is the contempt in which a husband will naturally hold a wife that is ignorant of the matters necessary to the conducting of a family. A woman who understands all the things above mentioned, is really a skilful person; a person worthy of avoid the patient's breath, and the vapour from meat, respect, and that will be treated with respect, too, by all but brutish employers or brutish husbands; and such, though sometimes, are not very frequently found. Besides, if natural justice and our own interests, had not the weight carries off the infectious vapours. which they have, such valuable persons will be treated with respect. They know their own worth; and, accordingly, they are more careful of their character, more careful not to lessen by misconduct the value which they possess from their skill and ability.

90. Thus, then, the interest of the labourer his health; the health of his family; the peace and happiness of his home; the prospects of his children through life; their skill, their ability their habits of cleanliness, and even their moral deportment; all combine to press upon him the adoption and the constant practice of this branch of domestic economy. "Can she bake ?" the question that I always put. If she can, she is worth a pound or two a year more. Is that the patient is confined to a small room, scarcely me at :- it should be covered with water during nothing? Is it nothing for a labouring man to one person in fifty who may be exposed to it, can the whole of the process of boiling-but not make his four or five daughters worth eight or ten pounds a year more; and that, too, while he do not escape it, though providentially less liable be covered with it,—the more savoury will be the is by the same means, providing the more plentifully for himself and the rest of his family? The reasons on the side of the thing that I contend for are endless; but if this one motive be not sufficient, I am sure all that I have said, and all that I could say, must be wholly unavailing.

(To be continued.)

GENERAL RULES FOR THE RESTORA-TION AND PRESERVATION OF HEALTH.

CONTAGION.

Contagion, or infection, is the communication of a disease from one body to another. In some cases it is conveyed by immediate contact or touch; in others, by infected clothes, such as cotton, and particularly wool, which of all substances is the most susceptible, because it is ex-tremely porous. Contagious matter, is also, though we apprehend erroneously, said to be transmitted through the air, at a considerable distance, by means of effluvia arising from the sick, in which case the atmosphere, is said to be infected.

Some authors have asserted, that the gout and consumption are likewise contagious; but this appears to be very doubtful. It is, however, highly probable, that those diseases may be communicated by the milk of nurses. In temperate climates, like that of Britain, there is but little danger of contracting them by infection, among adults; though, in the warmer climates of Eurepe, it will be prudent to take the necessary precautions against such accidents. To obviate as far as possible all infection, we would recommend the following rules:

Rules to be observed in the Apartments of those who are confined by Infectious Diseases.

1. It is of the utmost importance to the sick, and their attendants, that there be a constant ad mission of fresh air into the room, and especially about the patient's bed. The door, or a window, should therefore be kept open both day

The linen of the patient should be often changed; soon as it rises.

and the dirty clothes, &c. should be immediately ut into fresh cold water, and afterwards well boiled things. washed. The floor of the room should be cleansthe patient should be immediately removed, and scum. the utensils washed.

00 IMPORTANCE OF STRAW IN HUSBANDRY.

Value of different kinds of Straw.

The intrinsic value of straw must vary mateskewers, or a soup-plate laid the wrong side up-wards. rially, according to its leading properties, the quantity of manure into which it may be coneasily, and at a cheaper rate than by converting

neighbourhood, than in any other part of the excellent fod ter. The following observations were given to us by kingdom. It is sold there by the load, which

As straw is rarely permitted to be sold, being usually employed in maintaining winter stock, the real value of the article, to the farmer, is but inconsiderable, depending upon the quantity and quality of the dung it produces. So little is it hought necessary accurately to ascertain the value of straw, that in several cases it has been given by the out-going to the incoming tenant, as an equivalent for the expense of harvesting, FILLETS of VEAL; and many other joints, will thrashing, and marketing the last crop. It is bake to great advantage if the meat be good; I often thought insufficient to cover even that axmean well fed, rather inclined to be fat; if the pense, and a farther abatement is allowed on the price of the grain.

Various Purposes to which Straw is applicable.

The subject of feeding with straw will be better understood by considering the specific properties of the different kinds of straw employed in feeding stock, and the rules that ought to be observed when stock are fed with that material.

Wheat Straw.

This kind of straw, from its strength, is conbe thawed before boiling as before roasting;—if butter tied up in a piece of linen to baste the sidered to be peculiarly calculated both for litter it be fresh killed it will be tough and hard, if you back with, otherwise it will be apt to blister; and thatching; and indeed, wherever, the practice of cutting straw into chaff, for mixing with corn for horses, prevails, wheat-straw is preferred. When given to cattle or horses, it is sometimes cut into chaff, and either given raw taking care to have it on a stand, and when half sometimes cut into chaff, and either given raw done, to turn the other side upwards. A Duck in that state, or, what is greatly preferred, steam-

ed with other food, in particular with potatoes. In order to improve wheat-straw as fodder, it is the practice, in some parts of England, to cut best farmers were accustomed to cut wheat much earlier than common in their respective districts. One of these was a miller in Norfolk, who occupiseveral days before any one else thought of begin-A HAM (if not too old) put in soak for an ning, well knowing the good consequences in the value of the grain. It must also be less apt to be injured by shaking or harvesting.

Oat Straw.

Among the culmiferous grains, the straw of the oat is considered to be the best fodder, when given uncut. It is well known, indeed, that oatstraw, during the winter season, is almost universally given instead of hay, in all the best cultivated counties in Scotland, during the winter months, though that of peas and beans is certainly preferred where both are grown.

In some districts farmers cut cats in the straw into a species of fodder, which is called "cur meat." This is given not only to horses, but to cattle, especially fattening cattle. It is thought to give not only fatness but a fineness of skin to all sorts of stock.

Bean-Straw.

If well harvested, this straw forms a very hearty and nutritious kind of food for cattle in the winter season. Both oxen and horses, when duly supplyed with oats, in proportion to the work they have to execute, thrive well on it; wards.

Take care of the Liquor you have boiled poultry or meat in; in Five Minutes you may as thatch, these being the chief uses to which it may be con- and the reduced parts, or what is termed in Eng verted by littering, or its fitness to be employed land the coving-chaff, is found valuable, as a poultry or meat in; in Five Minutes you may as thatch, these being the chief uses to which it manager food, for the labouring teams; when ake it into excellent soup.

is applicable; but, in general, its price depends blended with other substances, it is probable on its vicinity to large towns. It is only in si that, in particular cases, the stems might be cut out converting the broth into some sort of Sour tuations where foreign manure can be procured into chaff with advantage; but when made use of in these methods, it should be used as fresh as tity, and the rest water; wash salted meat well the straw raised upon the farm into dung, that possible after being thrashed. A mixture of oean straw, (which by itself is rather dry,) and of Straw is generally dearer in London and its peas-haum, which is sweet and nour ishing, makes

But though this straw, more especially when respectable baker.

| consists of 36 trusses, of 36 lbs. each, or 12,196 | nixed with peas-haum, is of great value as fod-Baking is one of the cheapest, and most con-lbs. in all. Two loads of wheat-straw per acre | ler to the working stock of the farm, it does not suit well with riding-horses, as it is apt to hurt

and peas-haum are apt to occasion colic pains, or

This is an article strongly recommended by some farmers; for when the land has been dunged, and the seed good, the produce is considerable. The crop should be cut as soon as the blossoms begin to fall off, or the pods to form, and the whole converted into hay-tares require a great deal of sun to cure, and rain is very injurious to them. It would be a good plan to aix them with dry straw, which would improve ooth.

Rules regarding the consumption of Straw in

feeding Cattle.

Straw is much used in the feeding of Cattle in Scotland; and there can be no doubt, that oxen will feed well on straw and turnips, if the straw be good. It is recommended, in all cases, that for a month or six weeks after a bullock is put to turnips, straw only should be given with them: hay is so much superior, that it should if possi ble, be supplied. It is certain, at the same time, that hay is a very expensive food for stock, and ought to be saved as much as possible where it can prudently be done. It is well known that a full allowance of turnips and straw, during the winter months, will fatten better, than a small allowance of hay in place of the straw. In the spring, hay, which retains its nutritive juices longer than straw, is much more valuable, both for fattening stock and feeding horses; and it is therefore the practice to reserve hay for about three months consumption of these kinds of stock, and for no others.

Editorial Correspondence.

Extract of a Letter dated Lewisville, S. C. ? 29th May, 1824.

DEAR SIR,

We have lately had some extraordinary weather for the season-this morning the thermometer at 7.A. M. stood at 47, and at 3 P. M. rose only to 66-this day week it stood at 86 at 3 P. M. One of my neighbours is convinced he saw frost early of my neighborhood this morning. Wheat and continuous this morning that the continuous this morning that the continuous this morning. of the als and

General h-ituandrys risentic pillarof his farm.
Tilling my land with hired hands, I found on

In the first place, I drew a plan on paper, arranging the land into square and convenient lots containing from five to ten acres, having an eye to the convenience of water for each field, and to dollars per acre. I commenced fitting the lots and continued year after year in succession. The management of one may be taken as a specimen

of the whole.

I removed the rubbish at an expense of about \$2 per acre. The loose stones were then removed, and with posts and rails placed into perma nent fence, at an average expense of \$6 per acre. This expense added to the first cost of the land, makes an average of \$36 per acre, excepting repairs of buildings, when the land was fit for tillage. I then arranged my barn yards a little dish ing, where it was convenient, for making and preserving manure-I drew into them in the fall a quantity of turf and dirt from the knoles around my buildings, and the adjacent roads, and yarded my stock upon it during the winter. This course I pursued for a few years, until my crops so in creased as to furnish me with manure in a suffiploughman, who turned over the sod about three over it from six to eight three horse loads of manure per acre; and on the driest and most barren I have added three or four loads of old leeched twenty-five cents per bushel. ashes-rolled it down with a roller five feet long, and twenty inches in diameter. This was done

dolph, to the Secretary of the Agricultural Sociy of Albemarle. [Read May 10, 1824.] I have the honour to lay before the Agricultuety of Albemarle.

am induced, by what I have seen, to believe may ultimately prove a valuable acquisition to the husbandry of an elevated, uneven, and stony ed it, and before cross harrowing, it was seeded and dry region of the atmosphere, I have constantly found it so far advanced before the end of out of the ground one or two inches, it was sowed April, as to be in that stage of its growth at which it might be most profitably pulled, for acre, and rolled down to pulverize the lumps and smooth the surface for mowing. The expense of this crop was not to exceed ten dollars per acre; the roll of which eat it willingly enough. This specimen is far less forward than common, yet the pods upon it are nearly full grown now. It was found growing in fresh land, poor and stony, facing the East and sheltered on the West side. It grows luxuriantly in a forest of oak and chesnut on a high and dry ridge, but is more abun-dant about the fences and edges of fields farthest from water, near which I have never yet observed it. Like the other vetches it abounds the last of August or first of September, manured in seed, and is highly nutricious to all herbivocient quantity to give each of my lots a slight coat once in five or six years. In the spring it was the 15th September, I sowed it with red chaff ers say, in the green-pea state. It is by no means thrown into small piles in the yard. In the fall bearded wheat, one and a half bushels per acre, as succulent as the winter vetch of Europe, which commenced ploughing with a good and faithful and harrowed it in. The seed was prepared by is now naturalized with us towards the coast, and and harrowed it in. The seed was prepared by is now naturalized with us towards the coast, and washing it clean in a strong brine made with salt, may be found in Albemarle, at this time, by a inches in depth, and from eight to ten inches in and immediately rolled in lime, and I let it lie Botanist, from September until the following width. The dry part was back furrowed into moist twenty four hours to prevent smut and in-Botanist, from September until the following lands of twelve paces, and the wet into lands from twe to six paces wide, leaving a deep dead furrow to answer the purpose of a drain. I spread the control of the control about \$16 per acre—the produce from thirty-five tion by age, after having blossomed twice as red to forty bushels per acre, worth one dollar and twenty-five cents per bushel. Late in the fall or early in the spring, I turned during cold weather, but makes its appearance at up the old sod, harrowed and planted it to corn. any time with a day or two of genial temperato pulverize the lumps, and settle the manure and Tilled as before mentioned, except the barn yard ture, and then disregards frost, being naturally of land together.

Tilled as before mentioned, except the barn yard ture, and then disregards frost, being naturally of an uncommon firm texture in its stalk for a plant acre-had from eighty to a hundred bushels per of a genus so remarkable for succulence as the vetches. It is, most probably, I think, of the same species with the Vicia Sylvatica of Euof May it was well dragged or ploughed, with a down the hills, and in the spring prepared and rope, but yet, an American plant, and was found one horse plough; if ploughed it was harrowed down, and if it was wet and spring it was cast down—sowed and rolled as before stated, prointo small ridges, by throwing two furrows to duced from 50 to 60 bushels, if barley, from 25 to tanists of the Vicia Caroliniana, or Dumetorum, gether at a distance of two and a half feet from 35, if spring wheat, and from 70 to 80, if oats, or the Pairiflora, which is also to be found in the centre of the ridges, but without disturbing from 5 to 6 hundred pounds if flax per acre; and our mountains: nor yet that of the Ciacca of the sod; then crossed marked at the same disafterwards, for two or three years, from three and Europe, to which it comes much nearer than to tance. About the fifteenth or twentieth of May, a half to four tons of hay, or pasture in that proit was planted with eight rowed yellow corn, twelve quarts to the acre, wet in a pickle made of six ounces of saltpetre, two quarts of boiling wheat on the soil in the fall, I have turned it over in the soil of tar. This pickle was applied to the seed boiling hot, which immediately was rolled in plaster and planted. The head lands they had been washed in strong brine, and rolled sulcato aut subtetrageno; which latter charac-

Americana of Wildenow, and that neither of them differ with sufficient certainty, from the come extremely difficult from the innumerable Sylvatica of Europe. Vicia Ciacca, which this tough roots of that plant, and two crops of wheat resembles much, grows in meadows, or among small grain, not in wood, or very dry places, and they cannot well be the same. It is most probably, the Americana of Wildenow, which may not be a distinct species from the Sylvatics of Europe after all. Whatever it may be, I invite the attention of the Agricultural Society of Albemarle, to the fact of the existence among us in a wild state, of a plant so likely to become useful in rural economy. Every species of plant has some peculiar property, useful in some way, or agreea-ble, or useless and wholly unworthy of the notice ble, or useless and wholly unworthy of the notice it cannot attract, or hurtful, or even baneful. But how can that difference of properties be known, when the objects themselves, although made permanently distinct in their kinds from nature are not distinguished. Can it he said were annotative are not distinguished. Can it he said were named the biossoms of the plant laminy of the gramma with the eye of romance, poesy, or natural theology. My object simply is such a delineation of the principal gramineous plants, as will enable the reader to remove those named permanently distinct in their kinds from originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which is an orange-colour-plant and poesy, or natural theology. My object simply is such a delineation of the principal gramineous plants, as will enable the reader to remove those name or propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had been originally propagated in the field by cattle, which had nature, are not distinguished? Can it be said were penned upon wheat straw in Autumn, to make manure for a wheat fallow; than which to not attract the notice of any but Botanists, are wholly without useful or interesting properties? Season, when all weeds are in seed, or more bene-all the useful information collected by botanical Is it not the interest of every agriculturist, to learn to distinguish the various kinds of plants in his own fields?—which have been from the befrom seed wheat; and a farm in the county of their works. The sketch which I now contemginning, and will remain to the end of time, as distinct as they were made by the original impression received by each. Every plant now ance of it, carried with wheat, from the field of botanical nomenclature. Should some readers which is the subject of this communication. As want even this, a reference to any elementary sea-kale, was originally a tribute from botany to soon as a pretty full crop of flowers appeared, the rural economy. Every navigator, huntsman, sheep were brought back, and there being no traveller, farmer, or gardener, whoever brought grass for them, the blossoms were so entirely them. Such a reference, I take to be practicable wheat 1600 years before Christ, as better food for man than beans and peas, by Sir Walter Ra- ly. leigh, who had studied botany, and carried the potato to Europe, down to our own Meriwether Lewis, who was an excellent botanist, as well as a great hero, whose truly valuable present of a corn fit to grind by harvest, and many excellent garden herbs and roots, have been neglected al-ready from indolence. It is scarcely more than 40 years, since Sequeien, a physician and botanist of Williamsburg in Virginia, shewed us that the Tomato was eatable, which now every body deems necessary to keep the blood pure in summer. Many such discoveries combined, have ren-dered the present race of men in Virginia, healthier and longer-lived than the last.

I have the honour to be, &c. TH. M. RANDOLPH. PETER MINOR, Esq. Secretary of the Agri-cultural Society of Albemarle.

Copy of a letter from Col. Thomas M. Randolph, to the Secretary of the Agricultural Society of Albemarle. [Read May 10, 1824.] of Albemarle. [Read May 10, 1824.] I have the honour to communicate to the Agricultural Society of Albemarle, a fact which has recently come to my knowledge, of some interest, in my judgment, to rural economy, in the very important point of the extirpation, without cost, of noxious plants from fields while under pasture. A field of more than 100 acres size, in my farm near Charlottesville, has become very full of the plant sometimes called horse nettle, a species of Solanum, not the Solanum Carolinense of Michaux, for that is a perennial, and this is rite scenes of those infantine sports which the whole of their inferior joints. The number of knots or joints is pretty constant in each species. From each knot or joint arises a leaf, the lower part of which nature is then preparing to diversify the soft ground of the magnificent colouring with which nature is then preparing to diversify the soft ground of the earth. They clothe every spot of which envelops the culm, as a sheath, open in where the powers of spontaneous vegetation are in from the culm into an undivided limb, genevally plane, though sometimes rolled on itself. The leaves are commonly smooth—but in some tiguing it; and some of them perfume the valies and the hills, long before the rose, the lily, and the magnolia yield their sweets to the vernal with longitudinal and parallel veins or nerves—species. FOR THE AMERICAN FARMER.

BOTANICAL SKETCH of the principal gramina use ful, or likely to become useful, in husbandry.

No. I PREFATORY REMARKS.

The gramineous plants, of which it is my intention to present a concise sketch, are chiefly recommended by their extensive utility. They are not, however, entirely destitute of charms even for those who seek in vegetable productions only brilliancy of tints, or exquisite fragrance, and value them solely in the ratio of the pleasures which they afford to the senses, or to the imagination. The graming are for man the welcome of their inferior joints. The number of knows nation. The gramina are for man the welcome of their inferior joints. The number of knots of Michaux, for that is a perennial, and this is rite scenes of those infantine sports which the certainly an annual plant, but a species of that maturity of age often envies or regrets; youth end love ramble with ecstatic delight through sion which must necessarily arise from a mulplant has "aculei" like the briar, not thorns like flowery meads, or along luxuriant fields of waving tiplicity of names given to the same plant. The the hawthorn, for it is an herb, not a shrub. cerealia; and, after death, a green sod is often triticum repens goes by the following names—These "aculei" cover the leaves on both sides, placed and nurtured by the pious hand of gratic couch-grass, wheat-grass, dog's-grass, quick-and the calyx or flower-cup has some small ones tude or affection, on the humble tomb of depart-grass, creeping-rooted, &c. &c.

ter, and many other appearances, incline me to on it also. When old, they are fully as bad for ed worth. Further, the naturalist who ascends believe that the Vicia Ciacca of Michaux, found men or horses to go among, in proportion to their to final causes, and "traces nature's God through by him in Canada, is the same with the Vicia height and strength, as any briars or thorns nature's works," is filled with admiration for the provident wisdom of the Great First Cause, when he observes that, in respect to herbivorous animals, the time of that union intended to perpetuate their respective species, the period of gestation, and that of suckling their young, are so &c. may, upon quitting the nutritive fluid hitherto furnished by the maternal breast, browse the new and tender gramina in woods or in pastures— whereas there is no fixed and definite time for similar circumstances in the carnivorous tribes. But such considerations are foreign to my design ! I am not, in this place, to view the interesting

Outlines of Gramineous plants, in general.

There is a striking similarity in the general aspect of gramineous plants. Their stem, or trunk, assumes in botany the appellation of culm; it is cylindrical, and commonly consists of tubes connected with one another by knots or joints placed at certain intervals, and of a harder substance than the hollow parts of the culm, which they evidently are intended to strengthen, a purpose to which the cylindrical form is also pe-culiarly favourable. The culm adheres to the earth by fibrous roots—wheat, rye, barley emit three radicles—whereas all other gramineous plants hitherto known, have but one. From these roots often arise other roots of a larger

comes inflated. This is very conspicuous in Pha-laris, (canary-grass.) Besides this covering of the upper leaf, the fructification of the gramina delineation of some important genera and speterior, called glume or calyx, vulgarly chaff in my delineations, every adventitious ornament. broken open, the inner part was distended and or husk—the interior denominated corolla—each L. 92. Yet, on men go from year to year in this head may never entirely regain its natural shape. state of wretched dependence, even when they And there are, of course, stages of the dis-case in which no remedy will be effectual.

I am aware, Sir, that where a distemper has accomplished its ravages and spent its force, that mill to be found; where is the wheat to be got? some subjects will begin to withstand it, and and the difficulty is to discover what can be the

the case with regard to the cure I have suggest- 93. With regard to the mill, in speaking of ed; and I am far from holding it out as a certain families of any considerable number of persons, and effectual specifick for the disorder. But the mill has, with me, been more than once a since the experiment is one easily made, and I do subject of observation in print. I for a good assure you is attended with no danger, I hope while experienced the great inconvenience and uncertainty are great, In my "Year's residence in America," from paragraphs 1031 and onwards, my farm-yard; and I showed, I think very clearly, that corn could be ground cheaper in this way 91. Before I dismiss, however, this subject, let his land with his horses, or, in the season when

96. The cost of this mill is twenty pounds. The Dresser is four more; the horse path and wheel might, possibly, be four or five more; and I am very certain that to any farmer living at a again too readily, and the irritated and suppuration. It is impossible to conceive any thing more mile from a mill (and that is less than the aveting state of the wound may be advantageous; contemptible than a crowd of men and women rage distance perhaps;) having twelve persons and having kept open and sore for some time, it living together in a house and constantly looking in family; having forty pigs to feed and twenty hogs to fatten, the savings of such a mill would pay the whole expenses of it the very first y, ar. gress, the head will now gradually, and so slow-ly as to be scarce perceptible, shrink to its natu-ral dimensions. Where it has advanced further, activity and success of the old ones.

Such a farmer cannot send less than fifty tibles a year to the mill. Think of that, in the first place! The elements are not always propitious. Sometimes the water fails, and sometimes the wind. Many a farmer's wife has been tempted to vent her spleen on both. At best there must be horse and man or boy, and, perhaps cart, to go to the mill; and that, too, observe, in all weathers, and in the harvest as well as at other times however malignant and deadly it may have been, The answer is, where is there not a mill; where of the year. The case is one of imperious negenerally in its progress, yet that at this period, is there not a market? They are every where, cessity: neither floods, nor droughts, nor storms, nor calms will allay the cravings of the kitchen, nor quiet the clamorous uproar of the stye. Go, somebody must, to some place or other, and back they must come with flour and with meal. One summer many persons came down the country more than fifty miles to a mill that I knew in Pennsylvania; and I have known farmers in England, carry their grist more than fifteen miles those who have applied to you for information expense of sending my wheat and other grain to be ground. It is surprising that, under these on this subject will give it a trial, and communito be ground at a mill. This expense, in case of circumstances, hand-mills and horse-mills, should te to you the result.

a considerable family, living at only a mile from not, long ago, have become of more general use;

And with the best wishes for their success and a mill is something; but the inconvenience and especially when one considers that the labour, in this case, would cost the farmer next to nothing. To grind would be the work of a wet day. There I give an account of a horse-mill, which I had in is no farmer, who does not, at least fifty days in every year, exclaim, when he gets up in the morning, "What shall I set them at to-day!" If than by wind or water, and that it would answer he had a mill, he would make them pull off their well to grind for sale in this way as well as for shoes, sweep all out clean, winnow up some corn home use. Since my return to England I have if he had it not already done, and grind and seen a mill, erected in consequence of what the dress, and have every thing in order. No scold-owner had read in my book. This mill belonge ing within doors about the grist; no squeaking to a small farmer, who, when he cannot work on in the stye; no boy sent off in the rain to the mill.

97. But, there is one advantage which I have me say a word or two to those persons, who do he has little for them to do, grinds wheat, sells not yet mentioned, and which is the greatest of all; namely, that you would have the power of supplying your married labourers, your blacksmiths' space is so confined, and where the proper fuel ses; but what I would recommend to gentlemen men sometimes, your wheelwrights' men at other times; and, indeed, the greater part of the persons that you employed, with good flour, instead of their going to purchase this flour, after it had passed through the hands of a Corn Merchant, a baking bread at home. If the family consist of and dress the flour. The grinding of six bushels Miller, a Flour Merchant, and a Huckster, every twelve or fourteen persons, the money actually of wheat at nine pence a bushel comes to four one of whom, does and must, have a profit out of saved in this way (even at present prices) would and sixpence, which pays the man and the boy, the flour, arising from wheat grown upon, and be little short of from twenty to thirty pounds a supposing them (which is not and seldom can be year. At the utmost here is only the time of one the case) to be hired for the express purpose, out my people have flour at the same price that they woman occupied, one day in the week. Now of the street. With the same mill you grind would otherwise have been compelled to give for mind, here are twenty-five pounds to be employment for your pigs; and of this you will get worse flour. Every farmer will understand me ed in some way different from that of giving it eight or ten bushels ground in a day. You have when I say, that he ought to pay for nothing in to a baker. If you add five of these pounds to a no trouble about sending to the mill; you are money, which he can pay for in any thing but woman's wages. Is not that full as well employsure to have your own wheat; for, strange as it money. Their maxim is to keep the money that a not better employed for you; and is it not better wheat to find that I sent white Essex they take as long as they can. Now here is a not better employed for you; and is it not better wheat to the mill, and that it brought me flour most effectual way of putting that maxim in pracemployed for the community? It is very certain, that, if the practice were as prevalent as I counting for this, except by supposing that wind that it is the Saturday night which empties their could wish, there would be a large deduction and water power has something in it to change pockets; and here is the means of cutting off a from the regular baking population; but would the very nature of the grain; as, when I came good half of the Saturday night. The men have there be any harm if less alum were imported to grind by horses, such as the wheat went into better flour for the same money, and still the

degree of fineness you please.

mental in inducing a part of the labourers at any requires exertion. rate, to bake their own bread; and, above all Debility is the source of numerous disorders, things, to abandon the use of "Ireland's lazy such as spasms, palsy, violent evacuations, heroot." Nevertheless, so extensive is the ermorrhages, putrid and nervous fevers, fainting roneous opinion relative to this villanous root, fits, and apparent death.

that I really began to despair of all hope of checking its cultivation and use, till I saw the demaintaining feeble life (says Dr. Struve in his encourage him, doubtless, to be an advocate for ought to be proportioned to the temperature of the growing of this root of wretchedness. to be preferred.

Rules for feeding Sheep with Straw.

There is no food of which sheep are fonder than peas-straw. The soil of the pastoral districts in Scotland, being rarely of a kind calculasystem of sheep-farming with much more advantage. Indeed, the same plan might be advisable in other districts. It might be proper to add,

the Consumption of Straw.

On turnip farms in Scotland, it is the usual practice to feed horses till March, where the labour is not severe, and cows through the winter, with oat-straw, whilst the fattening and straw-yard cattle get the straw of wheat and barley. If any peas or beans be cultivated on the farm, clovers for hay. These are usually eaten by sheep, and no more hay saved, than what may serve the horses, cows, and fattening stock, for eight or ten weeks immediately before grass, with a small quantity occasionally given to the sheep fed on turnips.

The expense of feeding even the horses alone,

thrashing separates and exposes it so much, that tain for it, or that of the dung that could be made colour of which, attracted my attention, which if kept long, it is, comparatively speaking, of from it, as the kind used for thatch is seldom induced me to enquire the process of dying; the little value as fodder. Lisle, an intelligent wriused as fodder. Where economy must be attend-information I received was, to cut the end off of ter on agriculture, and a practical farmer, states, ed to in the building of cottages, straw is taken the largest pumpkin that could be obtained, the that he found cows did not eat straw so well on a as the least costly material; but in these days, seed only taken out, the yarn put in, and as Monday morning, as they did the rest of the when manure is so extremely valuable, as little much poak berry juice poured on as the pumpweek, because the straw was not fresh from the straw as possible should be spared for other him will hold, which should be set away in a fail. Straw, therefore, should be constantly purposes.

The durability of a thatched roof is likewise in about nine days, it produces a permanent and dry, and cattle do not eat it, nor thrive on it so very little repair during an ordinary lease. But washed out in soapsuds. I am induced to make well. It cannot be doubted that air has a very care must be taken that the straw is very clean this communication, thinking it might be desirating injurious effect upon all kinds of fodder, and the thrashed. If it is not, the grain left will soon ble to some of your readers. And I have no cattle, after the month of March.

When clover is sown with grain crops, the clover has often arrived at such a length, as to mix with the straw, but the ears are cut off, and the with the straw in cutting the crop. This cer-straw, bound in sheaves, and tied very tight is tainly improves the straw in good harvests; but as little clover as possible should be cut with the straw, as it makes it very difficult to secure the crop, unless it be left upon the ground for several

> -0-LITERARY.

Proposals have been issued for publishing a new Periodical work in New York, which from its objects as well as the known acquirements and talents of the Editor, we do not hesitate to believe will be highly worthy of publick patronage. The plan and terms of the work, and the views of the Editor will be clearly understood by the following exposition. Sub-scriptions will be received with pleasure by the Editor of the American Farmer.

Mechanic's and Manufacturer's Magazine. A Monthly Journal, devoted to the Arts and Trades of the United States. Edited by John Griscom, Professor of Mechanical Philosophy and Chem-

The resent Proposal originates in a belief, nind, that a Journal, devoted chiefly to the practical arts in this country, might be rendered

minently useful.

Whatever opinions may be entertained, with respect to the policy of encouraging, by statutory regulations and import duties, the manufacturing industry of the United States, it cannot be doubted, that both the useful and the elegant arts will continue so increase amongst us; and rial not much inferior to ordinary feathers; and it must be the wish of every one who is friend-The quantity of dung produced from a given being so much cheaper, chaff beds are almost ly to the prosperity of America, that the true Another purpose to which straw is applied, is may keep pace with its population ;-that no en

The most recent discovery, connected with ing with them, at stated periods, important and rists, and Divines, have their Journals, from which they obtain information suited to their respective wants. But there is not, as far as the Editor is informed, any publication in his country, particularly devoted to artizans and Sir, mechanics,—to that portion of our citizens on In the course of last autumn, I accidently met whom every class of society is dependent for is, to the grower, either the price he could ob- with some yarn in a family, of humble life, the its most essential comforts, and who constitute

and influence of the nation.

To supply this want, and to encourage among pend upon the indications this class of our busy population, a taste for list, after due time has been scientific inquiry, and habits of observation, are taining its probable amount. objects which the Editor has more immediately in view. His publication will not consist so much of learned essays on abstract principles of science, (which is the case with most of the philosophical journals of the present day,) as of pre-cepts and details adapted to the capacity of common readers. For this purpose he will avail himself, not only of the various fugitive notices of useful discoveries in our own country, but of the Scientific Journals of Great Britain, France, and other parts of the European Continent, With the most useful, as well as the most popular of these Foreign Journals, he is already familiar, and the means are secured of receiving such others as may contribute to the objects in view. Whatever relates to the real progress of the arts, and to the interests of American artizans and manufacturers, such as accounts of all new discoveries and inventions, economical processes, practical applications of the physical sciences, abridgment of labour, domestic receipts, &c. will come fully within the scope of the proposed Magazine. To these will be added specifications of the most useful patents, both of our own, and of foreign countries, thus giving to the work the advantages of the "Repertory of Arts," a monthly Journal, long esta-blished in the British metropolis, and extensively read by practical men. Space will be afforded for Biographical Sketches of eminent mechanics and engineers, and, if the work receive adequate encouragement, portraits, plans, and illustrative drawings, will also be found in its pages.
Original communications on the practical arts,

will at all times receive an attention proportion-

ate to their merits.

Subordinate to the primary objects of this Journal, as above stated, will be another of acknowledged importance, and which will receive all the attention which space and opportunity afford. This is the subject of literary and benevolent institutions. Under the first of these heads may be comprised, notices of improved modes of teaching,—of foreign schools and in-stitutions, distinguished for the excellence of their systems,—of useful school books, treatises on particular branches of learning, and on the moral government of children, and such other col-lateral topics as will tend to enhance, in the public estimation, the importance of the most improved methods of communicating instruction to youth.

A detail of the establishment and progress of other benificent institutions, such as Hospitals, Houses of Industry, Penitentiaries, &c. can hardly fail, it is presumed, to spread information that may be of service to the cause of hu-

manity in our rapidly improving country.

A monthly Journal, limited to objects of this nature, will not, as the Editor believes, essentially interfere with any known periodical work in the United States. To those of established utility, already in circulation, he wishes every success; and more especially to the American

be the Editor's aim to render this Magazine an instructive and useful companion, and wor thy of a place, when bound into volumes, among books of practical and useful reference.

contained an account of an extraordinary trotting match on Sunbury Common, (Eng.) in har eighteen hundred and twenty-four. ness. Mr. Giles trotted his mare 28 miles in the short space of one hour and 57 seconds, which is said to be unparalleled, and that there is no-thing like it on the record. But let us see how it compares with the match between Mr. Somerindike's horse Topgallant and Mr. Coster's mare Betsey Baker, who were matched for one thousand dollars aside, to trot three miles in harness, on the Jamaica road. They started yesterday at one o'clock, the horse drove by Mr. Purdy, and the Mare by Mr. Howard. The horse had the advantage in starting, as he came up hard in hand, and with fine action, a little ahead of the mare. The word was given to start, and the horse led the mare on in fine style, and beat her about 40 yards, performing the three mea-sured English miles in the short space of eight minutes and 42 seconds. Topgallant last summer performed 12 miles on the same road in 39 minutes, beating the celebrated horse Dragon, owned by T. Carter. All three of the above named horses were raised on Long Island. Mr. Purdy trotted the Albany Poney, on the same was performed in two minutes and 40 seconds. The Boston Blue horse trotted his eighteen miles within the hour; and the Tredwell mare trotted her a mile in two minutes and 34 seconds. >0

having procured Merino rams, were anxious to is too great for him, if continued for several days employ them in such a manner, as to obtain their successively. Another error on this subject ex-

many of the genuine Merino sheep, of both sexes, single embrace from him suffices, and that he I recollect to have seen in one of the early have been lately imported into the United States, numbers of your American Farmer, a short practitheir distribution has as yet been but partial, and males, distributing a single favour to each, and interesting branch of the same subject, and I be-blood, may be obtained in less time and on much invitations from the rest be what they may, he lieve from the same pen; I send it to you for re-easier terms, than by acquiring, in the first inpublication, should you deem it worth a place in stance, imported Merino ewes at the prices at tisfied, which will generally be the case, in the your columns. If not extensively useful, it will be which they have been sold, and will probably course of an hour or two, and after she has refound at least instructive to those curious in the continue to sell, it certainly is an object of econoharacter and habits of our domestic animals. my, as well of money as of time, with the farmer, I remember that I profited about that time by to make such expenditure as he can afford, in adopting some of the hints given in these two pa- the purchase of a ram, or of rams, and to build in like manner, and for about the same time. In pers, in so much, that from a small flock of thirty his proposed fine wooled stock on the sheep of imported Merino ewes, I did not during three successive years, lose but a single lamb. I will ney, at least, (taking into view the highest cost of the sheep of the country as a foundation; and economy of most of the sheep of as to these matters, it is requisite to remark, that from every mounting, or leap, on the part of the with your permission, describe the method I used. without injuring him.

A MARYLANDER.

30th August, 1811.

lander, without the intervention of the teaser, and Minutes, founded on experience, as to the means ly applies to the ram. of husbanding the vigour of the ram, and best enabling him abundantly to propagate his species.

the time being a separate name, and afforded a male and female, in this work of nature, are to cept in very young ewes. On this occasion, the ready means of knowing them from each other, be understood. In our climate, (that of Virginia female sheep, if not so amorous, is more passive, as well at the season of impregnation as at that and Maryland) the ewe is inclined to receive the than that of any of our domestic quadrupeds the of yeaning, during the first; the impregnated ram from the 1st of August to the 1st of Novem- dog not excepted; her inclinations are discoveraewes were registered every evening, and when the latter approached, recurring to the register and taking the reckoning of twenty one weeks, of the ewe, at all seasons of the year, when she with wethers, they will instinctively fondle on I had the expectants for the next four or five is not giving suck, and is in good condition; and her; when in company with or near the ram, she days removed from the flock, and put into a small indeed, there are many instances, when she takes days removed from the flock, and put into a small indeed, there are many instances, when she takes hospital shed and lot, provided for the purpose near the quarters of my people; and in severe which most ewes in a flock, with ordinary keep, weather to guard against the cold during the night, desire the ram, is, from the middle of Septem-to the most intelligent of alloted by turns from the most intelligent of my men, a watch for each night to set up in a room, in which was kept a good fire, and furnished with two or three baskets lined with wool; stinctive knowledge of an amorous female in his business was to visit the lying-in hospital company, that he is habitually quiet, regardless that the satisfied that every hour between dark and day break, to administer relief as occasion required, and particularly by bringing into the fire, such weakly or neglected subjects (neglected by the mothers) as might occur. For this service I promised a preprint to the man on data of a dellar for each it is termed, on the hour the man on data of a dellar for each it is termed, on the hour the man on data of a dellar for each it is termed, on the hour the content of the day and night, constantly exhausting biguards and thus presently dismisses him, satisfied that the pursuit is vain; yet will he in this way sue another, and another, through the whole flock, or which, (towards the end of July) he becomes during greater part of the day and night, constantly exhausting biguards by former to the man on data of a dellar for each it is termed. mium to the man on duty, of a dollar for each it is termed, or to hunt the ewes:—and during lamb that came during his watch and survived a this period, it is extremely difficult to keep them week. The success of the scheme surpassed my apart; they, both ewe and ram, will traverse the midst of his female companions. It does not expectations. The value of the lambs in those extensive tracts, or bound over high fences to always happen that impregnation is the consedays well enabled me to pay the premium, and get together; thence, great precaution and vigimals, there is a degree of uncertainty; in a case quarrelled with each other for the turn to be on is to be preserved unmixed. The stories told of failure the ewe returns to the ram, about the formula of the stories told of the storie the impregnation of a flock of fifty or an hundred ewes by a ram in one night, are extravagant be yond measure. In the first place, it is against nature. As to the female, in a flock of an hun dred ewes, it will be found, on the closest observation during the season, that not more than six or eight are amorously disposed on any given

mon sheep, has induced me to send you for publi-very great in this way, it will be seen on trial, cation, if you should deem it worthy of a place that half a dozen ewes are quite as many as he is in your Museum, a paper I had prepared this sum- disposed to pay his respects to, in the course of mer for the use of some of my friends, who twenty-four hours; and that even this provision very high prices, but worthy of attention at all stock, as numerously and as rapidly as possible. ists; the general belief seems to be, that a ram When it is considered, that, although very is so fast, and so sure, in his operations, that a passes rapidly through a flock of expecting fefrom ten to twenty minutes; when he seeks another similarly disposed, and remains her attendant with your permission, describe the method I used, of the rams), to obtain from each, every season, accidents and barriers prevent this; although the founded on the information so acquired, for saving as much service in propagation, as can be had action, in a case of failure, is very similar to one attended with success, and of as long, or nearly as long duration, yet to an attentive observer, off, I placed a number on the side of each, with fied that the ordinary service of a ram may be there is a difference; and the act of coition may a small brush dipped in tar. This mark, made doubled, by attending the hints contained in the be distinguished, not only by the motion of the male, at the instant of junction, but by his manner immediately on quitting the embrace, it has been wittily said, host coitum, omne animal triste est præter Gallum,* this general remark certain-

As to the ewe, she comes suddenly and rapidly into the disposition to meet her gallant, and then, for the time being, resigns herself entirely to First, the habits and propensities of the sheep, him; not the smallest coyness is observable, exunless arrested by some one really amorous, during greater part of the day and night, con-stantly exhausting himself by fatigue, and for the want of food, which he rarely takes when in the midst of his female companions. It does not quence of coition: with this, as with other anifourteenth day, and sometimes though rarely, this happens more than once to the same individual in a season; it may be reckoned, however, that not more than one in the number of seven or

eight will so return. The period of gestation is

greater part of the day, admitted occasionally to ewes occasionally, one roomy enough for them to he does not get a habit of butting, and to observe a few at a time, of such as are disposed to yield, move in, without being crowded, and the other the ewes so closely, whenever he has them about without the labor of running and sueing on his part, and left to sleep and feed quietly the rest of his time: he may impregnate in the field, running at large with the ewes, fifty or sixty; if kept well, and apart, he will certainly do justice to an hundred and fifty to a screen with the annual carbon the straight, to prevent accidents by pressing the sheep against corners; they dente well. When they proper arrangements are made, it was a second will not require more than one or two hours. They in a season.

safety and certainty, and with the least expense gates, or sets of slip bars, the larger pen should but in this, as in other matters, the superintenand trouble, is the object. By some, teazers are open, on one side, into the smaller; on another, dance of the master will make all more safe and used, to facilitate the process; that is, a common into the ram's paddock; and, on a third, into the more sure. ram is made an instrument wherewith to ascertain intervening lot or pasture. the disposition of the ewes, and as fast as they are found to be in the proper humor, they are to the ram, which each person will determine by taken from him, and put in with the more favored the time he wishes his lambs to drop, all those breeder. This method, without great care, and close attention, is hazardous; the teazer may overact his part, and introduce a spurious race: commences, should be well fed, but not excessed degrees, to such as are more difficult: we, thereoveract his part, and introduce a spurious race: commences, should be well led, but not excess degrees, to such as are more difficult: we, thereto give an opportunity to such as may chuse to sively, on grain, every morning, at or before day fore treated of plain Boiling, and we now proceed adopt it, however, it will be described. There break. At sixely, the ewes are to be driven up to Roasting:—we shall then gradually unravel, to are two ways of using a teazer: the most ready, into the larger pen, before described: the ram is our culinary students, the art, (and mystery, unare two ways of using a teazer: the most ready, into the larger pen, before described: the rain is our culinary students, the art, (and mystery, unif well watched, is to put him once a day, loose among the ewes, in a small pasture, having first nicates, is turned in to them, for half an hour fixed on him an apron, to prevent mischief, and colored it with a little dry paint, ochre, or lamp-black, that he may leave his mark on each ewe described: the rain is our culinary students, the art, (and mystery, untitle developed in this work) of making with the least trouble and expense, the most highly-fiobserver, will readily discover, by the habits
black, that he may leave his mark on each ewe described: the rain is our culinary students, the art, (and mystery, until developed in this work) of making with the
least trouble and expense, the most highly-fiobserver, will readily discover, by the habits
black, that he may leave his mark on each ewe are inclined and will learn to the first part of this paper, which of willing to receive him: this apron is made of the ewes are inclined, and will learn to put his en;—the first preparation for Roasting is to take eye on some distinguishing mark on each, where-square; and by means of two strings, is, at one ed, fastened round the body of the sheep, (a ribbon of the wool, an inch wide, being first taken four or five may be so selected, the keeper takes of the sheep takes of the off, all round the part to which the apron is to be secured, to prevent its slipping,) the rest is loose, so that when he stands in his ordinary position, the apron hangs down perpendicularly just forward of the parts of generation, and touching lampblack, or something of the kind, rubbed on and loins—that the carver may separate them

In preference, the following process, having more apt to conceive: when his female compan-been tried, and found to succeed entirely, is rebeen tried, and found to succeed entirely, is re- ions are taken from him, the ram will feed and before she futs her meat down to the fire, pass a commended, as the most safe, though not quite recruit, and at sun set he should have another strong skewer through each end of the joint: by so advantageous to the breeding ram. In the first good bait of grain; under this treatment, if he this means, when it is about half done, she can place, for this system, (as for that where the is hearty and vigorous, he will remain in good with ease turn the bottom upwards; the gravy teazer is employed,) let there be provided a paddock of an acre or two of good grass, containing shade and water, and well fenced, for your stock ram; here let him be confined with the whole, or nearly the whole flock shall have one or two wethers for company, at least a month been marked by the ram, and thus passed into the whole instrument for roastbefore the season commences, and well fed on the distant pasture, they should be returned to ing.

A dutch oven, is another very convenient utenses as to get him in high order, and quite gentle; as described in the first instance; when some will sil, for roasting light joints, or warming them up.

pregnate; and a ewe will become a mother at the be handled by the horns. Between the principal run with the whole nock, in a hear and safe pastwelve months, unless precautions are taken to pasture, in which the ewes are kept, and the pasture, in which the ewes are kept, and the ram's paddock, there should be, if it can be contently provided, an intervening lot or pasture. The attendance on the breeding sheep, during that the same powers of propagation cannot belong to a ram at large with a flock of ewes, that will be possessed by one separated from all, the pasture is not the first that the same powers of propagation cannot belong to a ram at large with a flock of ewes, that will be possessed by one separated from all, the pasture is not pasture, in which the ewes are kept, and the ture, that he may finish any little part of his work that the same powers of propagation cannot belong to a ram at large with a flock of ewes, that will be possessed by one separated from all, the pasture is not pasture, in which the ewes are kept, and the ture, that he may finish any little part of his work that the same powers of propagation cannot belong to a ram at large with a flock of ewes, that will be possessed by one separated from all, the pasture is not pasture, in which the ewes are kept, and the ture, that he may finish any little part of his work that the same powers of propagation cannot be adjoining the ram's paddock, and within the instance on the breeding sheep, during the same powers of propagation cannot be adjoining the ram's paddock, and within the instance on the breeding sheep, during the same powers of propagation cannot be adjoining the ram's paddock, and within the instance on the breeding sheep, during the same powers of propagation cannot be adjoining the ram's paddock, and within the instance of the sam To effect our purposes, then, with the most form a side of each pen: by means of three small day, of the keeper's time, to attend to his sheep.

When the season has come for putting the ewes the ground: when he mounts, the apron falls back, covers those parts, as he rises, and becomes a complete barrier to his access. The other, and the safest, mode of employing the exceeding four, are turned in with him, there to other, and the safest, mode of employing the exceeding four, are turned in with him, there to part of it;—therefore, be provided with balanservices of a teazer, is, to have him confined in remain till the evening. The flock of ewes are cing skewers, and cookholds, and see it is propera high, secure, but open fenced little pen, adjoining the enclosure in which the ewes are pastured; and exactly against his pen, and within
the ewes' enclosure, to have another pen openthe ewes' enclosure, to have another pen openan hour or the trends of ewes are ling skewers, and cooknoids, and see it is propering skewers, and cooknoids, and cooknoids, and cooknoids, and see it is propering skewers, and cooknoids, and cooknoids, and see it is propering skewers, and cooknoids, and cookno ing, by means of a small gate, into that enclosure, been served, as will be seen by the mark his is in fact baked; the machines the economical so that the ewes, when the gate is left open, may, by entering this last pen, approach the ram, within the thickness of the fence, see him, &c. and those not served, if any, returned to the flock they should be driven up to that part of the field they came from. This operation being repeated mist of fuel, when he contrived these things, once or twice a day, when it will be seen that daily, will gradually diminish the number of vithose disposed to take the ram, will be found siting ewes, and make every selection easier both hankering about the teazer, and generally in the to the ram and the keeper; and another advanpen, prepared for the convenience of catching, as tage is, that by withdrawing the served ewes, for above described.

twenty-one weeks, two or three days more or less. he should wear a leathern collar about his neck, again be found disposed to take him: and finally, to-Both sexes of this animal copulate at an early age, for the facility of leading, unless he be horned, in ward the end of the season, he ought to be turned

^{*} Small families have not always the convenience of roasting with a shit,—a remark upon roasting by a string is necessary. Let the cook,

accustomed to enjoy BEEF well ROASTED, will from it, the process of ROASTING is attended by the meat soft and mellow on the outside and the soon be convinced, that the poet who wrote our so many ever-varying circumstances, that it fire acts with more force upon it. national ballad at the end of this chapter, was must remain among those which can only be per-

All your attention in roasting will be thrown away, if you do not take care that your meat, esnecially beef, has been kept long enough to be ten-

Make up the FIRE in time: let it be proportioned to the dinner to be dressed, and about three or four inches longer, at each end, than the thing to be roasted—or the ends of the meat cannot be done nice and brown.

A cook must be as particular to the proportion her fire to the business she has to do, as a chemist -the degree of heat most desirable for dressing the different sorts of food ought to be attended to with the utmost precision.

The fire, that is but just sufficient to receive the noble sirloin, (No. 19) will parch up a light-

er joint.

From half an hour, to an hour, before you begin to roast, prepare the fire, by putting a few coals on, which will be sufficiently lighted by the time you wish to make use of your fire;-between the bars, and on the top, put small or large coals, according to the bulk of the joint, and the time the fire is required to be strong; -after which, throw the cinders (wetted) at the back.

Never put meat down to be burnt up by fire, if you can possibly avoid it; -but should the fire

distance, and allow a little more time.

Preserve the fat,† by covering it with paper for this purpose, called "Kitchen Paper," and tie it on with fine twine; pins and skewers can by no means be allowed, they are so many taps, to let out the gravy: besides, the paper often starts from them and catches fire to the grent injury of the meat.

If the thing to be roasted be thin and tender, the fire should be little and brisk; when you have a large joint to roast, make up a sound, strong fire, equally good, in every part of the grate-or your meat cannot be equally roasted, nor have that uniform colour which constitutes the beauty

of good roasting.

an vy ery-

st-

Give the fire a good stirring before you lay the joint down; examine it from time to time, while the spit is going round; keep it clear at the bottom, and take care there are no smoky coals in the front, which will spoil the look and taste of the meat, and hinder it from roasting evenly.

When the joint to be roasted, is thicker at one end than the other, place the slanting, with the

thickest part nearest the fire.

Do not put meat too near the fire at first; the larger the joint the farther it must be kept from the fire:-if once it gets scorched, the outside vented from penetrating into it, the meat will appear done, before it is little more than half done, besides losing the pale brown colour, which it is the beauty of roasted meet to ave.

From 14 to 10 inches is the usual distance at which meat is put from the grate, when first put down: it is extremely difficult to offer any thing but, when the meat is rich, and yields much of it,

uals ;-but the rational epicure, who has been a graduated shit-rack to regulate the distance is basted, the less time it will take, as it keeps observation.

> "Mr. Watt, for his steam engines where wood well is employed, allows three times the weight of ten or fifteen minutes for the former, and about Wood, that he does of Newcastle Coals—and as long for the latter, more or less according to a bushel of Newcastle Coals, which weighs 3 of the temptations the "Bon Gour" of these prea Cwt. is reckoned to produce as much heat as a ceding courses has to attract their attention.

Cwt. of Scottish or Glasgow Coal."

If you wish your JACK to go well, keep it as and DRIPPING PAN back, and stir up your fire clean as possible, oil it, and then wipe it; if the thoroughly, that it may burn clear and bright for oil is not wiped off again, it will gather dust; to the Browning :-when the steam from the meat prevent this, as soon as you have done roasting, draws towards the fire, it is a sign of its being cover it up.—Never leave the winders on whilst done enough; but you will be the best judge of the Jack is going round, unless you do it, as Swift that, from the time it has been down, the strength says, "that it may fly off, and knock those trou- of the fire you have used, and the distance your blesome servants on the head who will be crowd-ing round your kitchen fire."

Be very careful to place the DRIPPING-PAN at such a distance from the fire, as just to catch the drippings: if it is too near, the ashes will fall into it, and spoil the Drippings* (which we shall fully; you cannot do this delicately nice without a hereafter shew, will occasionally be found an ex-very good light; the common fault seems to be hereafter shew, will occasionally be found an ex- very good light; the common fault seems to be cellent substitute for butter or lard.) If it is too using too much flour; the meat should have a far from the fire to catch them, you will not only lose your drippings, but the meat will be blackened, and spoiled by the fætid smoke, which will arise when the fat falls on the live cinders.

The time Meat will take Roasting will vary according to the time it has been kept, and the tembecome herce, place the spit at a considerable perature of the weather :- the same weight will be twenty minutes, or half an hour longer pearance to the eye, that the palate in Cold Weather, than it will in warm—and if possessed in its favour at first sight. fresh killed, than if it has been kept till it is tender. Cooks seldom calculate according to the

variations of temperature, &c.

A goon MEAT SCREEN, is a great saver of coals It should be on wheels, have a flap top, and not be less than about three feet and a half wide, and with shelves in it, about one foot deep it will then answer all the purposes of a large Dutch oven, Plate Warmer, Hot Hearth, &c. Some are made with a door behind-this is convenient-but the great heat they are exposed to, soon shrinks the materials, and the current of air through the cracks cannot be prevented—so they are better without the door.

Every body knows the advantage of Slow Boil -SLOW ROASTING is equally important.

It is difficult to give any specific RULE for TIME ;-but if your fire is made as before directed,-your Meat Skreen sufficiently large to guard what you are dressing from currents of air, —and the meat is not frosted,—you cannot do better than follow the old general rule of allowing rather more than a Quarter of an hour to the Pound; a little more or less, according to the describe the process, and teach the fire:—if once it gets scorched, the outside temperature of the weather,—and in proportion will become hard, and acquire a disagreeable as the piece is thick or thin.—the strength of the empyreumatic taste; and the fire being pre-fire,-the nearness of the meat to it,-and the frequency with which you baste it; the more it

* This the Good Housewife will take up occasionally, and pass through a sieve into a stone pan: -by leaving it all in the Dripping pan, until the meat is taken up, it not only becomes very strong, like an accurate general rule for this,—it depends it is aft to be sfill in basting.—To clarify Driftso much upon the size of the fire, and of that of pings, see No. 83.

Reckon the time, not to the hour when dinner not inspired by Sir Benjamin Thompson's cook- formed well, by frequent practice and attentive is ordered-but to the moment the Roasts will be wanted-supposing there are a dozen people to sip soup, and eat fish first; you may allow them

When the Joint is half done, remove the Spit

spit has been from it.

Half an hour before your meat is done, make some GRAVY, and just before you take it up, put it nearer the fire to BROWN IT. If you wish to FROTH it,-baste it, and dredge it with flour carefine light varnish of froth; not the appearance of being covered with a paste; -those who are particular about the Froth, use butter instead of dripping;

" And send up what you roast, with relish-giving Froth,"

says Dr. King, and present such an agreeable appearance to the eye, that the palate may be pre-

A good cook, is as anxiously attentive to the appearance and colour of her Roasts, as a Court Beauty is to her complexion at a Birthday Ball.

Though roasting is one of the most common, and is generally considered one of the most easy and simple processes of cookery,-it requires more unremitting attention to perform it perfectly well, than it does to make most made dishes.

That Made-dishes are the most difficult preparations, deserves to be reckoned among the Culinary Vulgar Errors; -in plain roasting and boiling, it is not easy to repair a mistake once made; and all the discretion and attention of a steady careful cook, must be unremittingly upon the alert.

A diligent attention to time, -the distance of the meat from, and judicious management of the fire, and frequent bastings -are all the general rules we can prescribe. We shall deliver particular rules for particular things, as the several articles occur, and do our utmost endeavours to instruct our readers as completely as words can

"The management of common things so well, That what was thought the meanest shall excel; That Cook's to British palates most complete, Whose sav'ry skill gives zest to common meat: For what are your soups—your ragouts—and your sauce, Compared to the fare of Old England, And old English Roast Beef!"

§ When the steam begins to arise, it is a proof that the whole joint is thoroughly saturated with heat; any unnecessary evaporation, is a waste of the best nourishment of the meat.

there is more fat than you think will be eaten with the lean—trim it off, it will make an excellent pudding. (No. 551, or 554) Or clarify it. (No. 83.)

I our ancestors were very particular in their Bastings and Dredgings, as will be seen by the following quotation from "May's Accomplished Cook." London 1665, p. 136.—"The rarest excellent pudding. (No. 551, or 554) Or clarify and rost as usual:—but we recommend you to ways of dressing of all manner of rost meats, bring it into the kitchen the night before, or early either flesh or fowl, by sea or land, and divers in the morning of the day you want to roast it, ways of breading or dredging meats to prevent and the warm air will thaw it much better.

BOTANICAL SEETCH of the principal gramina use ful, or likely to become useful, in husbandry. No. 11.

Before I enter upon the promised delineations of the most interesting genera, species, and va-rieties of the vegetable family under consideration, I beg leave to refer the reader to the Essay on the Geography of plants, &c. and to the Prolegomena de distributione geographica plantarum, Ge. of the illustrious Alexander De Humboldt, who may justly be called the scientific luminary of both hemispheres. The isothermous parallels, or lines of equal average annual heat, which he has established, will be found of infinite use to fix hitherto vague and unsteady views on the subject of vegetable geography; and the results de-rived from the researches of the ingenious and learned author, cannot fail of affording to the inquisitive the liveliest gratification.

In North America, and in countries under the same isothermous para!lels, the number of gramineous is to the totality of phanerogamous plants, nearly in the proportion of one to ten-according to F. Pursh, the latter amount, in N. America, to 2891, and the former to 275 species. By phanerogamous plants are meant those whose sexual organs are 8. Holcus mollis. Lin. Creeping soft grass. visible. Mosses, &c. are, therefore, no part of 9. Holcus Striatus. Lin. Striated H. that totality. Humboldt published his trolegomena in 1817. Since that epoch, many accessions 11. Holcus halepensis. Lin. Holcus of Aleppo. have been made to the North American Florabodied into a new Flora, the same proportion will be so. still be maintained—for, discoveries will not be confined to gramineous plants alone. The laws of the above species are, by modern Botanists, established by Humboldt are so constant that, referred, on account of certain differences, to other in view-and, in doing so, first introduce those plying distinctions, names, &c. &c. genera which have, for some time past, particu-Holcus, Milium, Panicum, &c.

HOLCUS .- (Triandria, Digynia.). Observation .- The name Holcus comes from a Greek word signifying to draw, from the property ascribed to this plant by the ancients, of drawing to itself light bodies that might have penetrated the skin. I do not know of any English generic name for it-but there are vulgar

-acute and awnless-and three stamina. The parts most flexible, and having nothing within fruit is oval-sometimes round-sometimes reni-them to oppose the contractile power. At the form. The corolla partly invests it-and is more lower part or bottom of the crust, there may be

digenous species. nish an excellent forage.

I will describe the following species : Pennisetum typhoideum. Pensoon. S. Millet-Couscou-Millet à chandelle .- (4 varie ties.)

L. H. GIRARDIN.

names for the several species, and these will be fect in horses; and though it sometimes takes which rises on the surface: add to this four ounces mentioned. For the sake of simplicity, it will place under the best management, and even in of linseed oil, and give it as a drench twice a day. be made to include here some species separated colts that have never been shod, or taken from a If the cough is not perceptibly lessened, by taking from it, &c.

Generic Characters. The flowers assume, improper treatment. If we cut off the foot of a continued. If the owner of the beast is not satisfied in trusting afterwards to nursing and shelter in some species, the form of a spike-in other dead horse, and keep it in a dry but cool airy si- fied in trusting afterwards to nursing and shelter species, that of a panicle. They are polygamous, tuation, so that it may not soon become putrid, it from the inclemency of the weather, he may try that is, some of them hermaphrodite—and some will be found to undergo no alteration in its form, Dr. Clater's curious and potent recipe, the in-unisexual. Each hermaphrodite flower has a though kept a considerable time; but if the congredients of which amount to about one pound in calyx with two persistent valves—which contains tents of the hoof are taken out, which may be 1, 2, or even 3 corollas, also with 2 valves each, done by keeping the foot a few days in hot dung, shorter than those of the calyx, the exterior the hoof will then be found to shrink or contract, valve being often awned at its summit. There are particularly if kept in a warm situation, or ex-3 stamina—and 2 styles in each hermaphrodite posed to the sunshine. This contraction will take flower. The male flowers have neither calyx nor place principally at the higher part or coronet pistil—they have only a corolla—with two valves and towards the heels; the horn being in these or less easily separated from it, after maturity, the same tendency to contraction; but here the according to the species.

horn is much thicker, and the contractile power is strongly opposed by the bottom of the hoof,

Several species are remarka-that is, the frog, the bars, and the sole. If the ble by their size. Some afford food to man in a bottom of the foot is removed, the heels will then farinaceous fruit: others contain in their stem or contract rapidly, and in two or three days will culm, a saccharine principle. Others, again, fur- not only have approached close to each other, but will be bent or curled inward. What then, it may be asked, is it that prevents contraction of the hoof in the living horse, and by what circumstances is the tendency or disposition to contract produced? The hoof, in its healthy state, is pervaded by a fluid, by means of which it is pre-served in a flexible and elastic state. If by any means a preternatural degree of heat is excited in the foot, this fluid will be too quickly dissipated, and the supply will be diminished; the horny matter will therefore be disposed to contract or shrink, and the contraction will take place more or less rapidly, according to the degree in which the disposition to contraction exists, and the resistance that is opposed to it. In the perfect foot, or one that has not been mutilated by the smith, the tendency to contraction is powerfully resisted by the bottom of the hoof, consisting, as before observed, of the sole, bars, and frog; as well as by the coffin-bone, and other parts which it incloses, and by which it is completely filled. Unless the contractile disposition is considerable, the resistance thus afforded is often sufficient to prevent contraction; but when the bars are destroyed, the frog mutilated, the shoes made and applied improperly, and the horse made to stand great part of his time on litter, contraction will often take place; for though the internal or sensitive it sustains causes a gradual absorption to take place, and the contraction will proceed as the resisting medium is thus removed. Various mechanical contrivances have been suggested for the prevention and cure of contraction, which will be described under the head shoeing and management of the foot.

Hoose. A term to be found only in the nosology of Cow Doctors. It signifies a cough, either chronic or acute, which cattle are affected with from exposure to cold winds or rain. The treatment consists in bleeding, if there be any symptoms of fever, as quick pulse, and redness of the under surface of the eye-lid, and particularly if the breathing is disturbed; and if the animal in costive, in giving some opening medicine. A moderate degree of warmth, which may be obview the descriptions of the various species of this tained by bringing the animal under cover, and giving warm mashes, is also necessary. In obstinate coughs the following drench may be given, but careful nursing will generally be found sufficient to remove the complaint:

Honey, four ounces; Vinegar, six ounces:

Hoof, Contracted. This is a very common de-mix them over a slow fire, and take off the scum

Balsam of sulphur, two ounces; Barbadoes tar, one ounce; The yolks of two eggs; Ginger, Aniseed. Cummin seeds. of each, in powder Elecampane root, one ounce : Grains of Paradise, and Liquorice root,

Salt of tartar, half an ounce;

Honey, four ounces. duced by wounds, bruises, strains, or other acci- kinds, viz. of the hoof and parts contained withneral fulness, from over-feeding and insufficient parts connected with them; and of bones. In exercise : it may be brought on also by having the each of these divisions there are several diseases, perspiration sudd nly checked, or by making the which will be noticed in their respective places. horse stand in very cold water, and immediately Mr. R. Lawrence observes, that a peculiar after on warm litter. Sometimes it takes place conformation of the limbs renders a horse more without any known cause The treatment of inflammation depends, in a great measure, on the Thus horses with short pasterns, and whose fore degree or extent of the injury, its situation, and legs incline much under the body, are most liable the condition or state of the animal. The usual to bony excrescences, such as splent, ring-bones, remedies are bleeding, both general and local, &c. Horses with long pasterns are more liable

mentations, cold lotions, &c. Kidneys. These are two glandular bodies, situate in the abdomen. The right is attached to to those diseases of the bones which arise from the posterior edge of the liver, and lies under the concussion, such as ring-bones. Horses that are sixth or seventh rib, the left is rather lower, and cat-hammed or cow-houghed are particularly usually under the last false rib. The urine is se-subject to spavins, curbs, and thoroughpins. The creted by the kidney, and, when formed, is con-tendency to lameness of every description is greatveyed by numerous small tubes to a cavity in its ly increased by working a horse at too early an centre, named Pelvis: from this cavity, a tube age, and particularly by placing too much weight called Ureter proceeds, by which it is conveyed upon them at that period. "Farmers and breedto the bladder. The ureters, in entering the ers of horses ride them from three years old, bladder, pass obliquely between its coats; by this until their legs and feet from premature exertion contrivance, a complete valve is formed, which are so much injured as to render their soundness prevents the return of the urine when the bladder doubtful; and this state often comes on before contracts. The kidneys of the horse are much they are six years old. Under these circumstanmore readily affected by diuretics than the human ces they are offered for sale, and generally warkidneys; and, though an excessive or indiscri-minate use of them has often done mischief, I manifest lameness in any particular leg by a want think they may be considered as the most useful of harmony in their motion, yet their injured state class of veterinary medicines, when judiciously may be detected by their stepping short with employed. Stones are sometimes formed in the their fore-legs, and pressing principally on the pelvis of the kidney, whence they often pass into toe; and upon examining the legs when standing the ureter, but are seldom found in the bladder; still, if the pasterns (particularly long ones) approbably from the horizontal position of the ani-pear perpendicular and not oblique in their direcmal. The kidneys of the horse are often inflam-tion, or if the fetlock joint knuckles over, or in ed, and not unfrequently, I believe, by the im- other words bends forward, little doubt may be moderate use of diuretics. Sometimes the in-entertained of their being unsound." In all cases flammation proceeds rapidly, producing fever and of lameness, unless the cause is evident, it is other distressing symptoms. The animal usually proper to examine the foot carefully in the first stands with his hind legs stretched out, as in the place. Mr. Clark very properly advises, if the act of staling; there is a tenderness about the nature of the case appear doubtful, to inspect the loins which makes him shrink or give way when foot again the next day, or even a third time, they are pressed upon: there is a stiffness in the rather than give too hasty or precipitate an opinmotion of the hind parts, which is sometimes ion with respect to the seat of the lameness; for considerable. He frequently attempts to void the foot is always to be suspected, especially after urine, while only a few drops are expelled, and a horse has been new shoed, or has had its shoes that with considerable pain and difficulty. This fastened; or when the shoe lies too flat and presssymptom has sometimes led the attendants to sup. es upon the sole, or there is a corn in the foot. pose, that the bladder is full, and that there is a No certain rules can be laid down for discovering stoppage of urine; under this idea, diuretics have the seat of lameness by the manner of the horse been given, which generally so aggravate the dis-ease, as to cause the animal's death. But if the motion of the body are injured, the adjacent parts the hand through the fundament into the rectum, times attended with symptoms of colic, the horse often laying down and rolling: in such cases the inflammation probably has spread to the peritoneal coat of the adjoining bowels. The best re-medies for this acute kind of inflammation of the kidneys are plentiful bleeding, emollient clysters, an oily laxative, and covering the loins with a fresh sheep's skin, the wool side outward. If the slightest pressure of the finger.

g

ON BATHING.

"This is the purest exercise of health, The kind refresher of the summer heat : Nor when cold winter keens the brightening flood Would I weak-shivering linger on the brink Hence the limbs knit into force; And from the body's purity the mind Receives a secret sympathetic aid."

Messrs. Editors-The annexed rules (which experience has established and physiology approved) are submitted for the benefit of Bathers. It is to be hoped that our baths will soon become a place of fashionable resort, and the exertions of our ingenious and benevolent fellow citizens be met by an adequate reward. CIVIS.

1. Bathe one hour before breakfast, or what is much better, an hour before dinner.

2. The stomach should always be empty when we bathe.

3. Never take the cold bath when the temperature of the body is below the natural standard.

4. To prepare the tepid bath, which is the best in this climate. The rule should be this-bring the water to that temperature which feels neither hot nor cold to the arm, or some part of the body usually covered; and, after entering the bath raise its heat to that point which imparts the most agreeable feeling.

5. We should take exercise before and after the warm bath; the importance of this is every day evinced where bathing is practised.

6. After leaving the water, the body should be briskly wiped with a coarse towel, and immediately covered with sufficient clothing to excite or preserve the healthy temperature.

7. We should never remain long in the water. From 10 to 15 minutes is sufficient.

8. Every second or third day is often enough to

By a regular use of the bath governed by the above rules, we shall always feel more light, cheerful and active, and better fitted and more inclined for a full and successful employment of the powers of mind and body.

LAMP TEA KETTLE.—The Editor of the New England Farmer has invented and applied to use what he conceives to be an improvement on any methods heretofore made use of for heating or boiling water by a lamp, cooking by steam, frying, &c. by means of heat derived from a lamp.

The lamp is a tin vessel, shaped like a common tin porringer, which will contain about a pint. To this a cover is adapted, perforated with

tubes to receive the wicks. The tea kettle is set, and may be soldered in a embrace it so closely as to prevent the heat of the lamp from pervading the sides as well as the

AGRICULTURE.

PAPERS

has been that of a farmer, and my attention has been much engaged by the variety of operations putting around each stalk of corn a double hand-connected with agricultural life; being a novice at the period of commencing, I adopted that course which the more experienced farmers of the lot was manured around the stalk in that way, the neighbourhood were pursuing, and which I suppose had been handed down from father to corn a double hand at that season of the year were then employed in WM. CASTLEMAN, Jr. S. K.

October 30th, 1823.

OF GROUND FOR CORN—TO WIT:

It being a piece of dry bottom land, I commenced which were the manured and the lot was manured and the very large of the lot was manured which were the members of the lot was manured around the stalk in that way, but the advantage of the top dressing was not persuiply and of the lot was manured around the stalk in that way, but the advantage of the top dressing was not persuiply and of the lot was manured around the stalk in that way, but the advantage of the top dressing was not persuiply and of the lot was manured around the stalk in that way, but the advantage of the top dressing was not persuiply and of the lot was manured around the stalk in that way, the lot was manured around the stalk in that way, but the advantage of the top dressing was not persuiply and the lot was manured around the stalk in that way, the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, or ground each stalk of corn a double hand-full of the lot was manured around the stalk in that way, o son, through many generations; and although I ferent parts of the lot unmanured, which were have been convinced by sad experience that the equally as productive as those that were. One hoe-old "modus operandi" (particularly with regard to the cultivation of corn) was greatly defeative, we continued the cultivation of corn) was greatly defeative, we continued the cultivation of corn) was greatly defeative, we continued to the cultivation of corn) was greatly defeative, we continued to the cultivation of corn was greatly defeative, as there were two rows left through different parts of the lot unmanured, which were and put on 427 cart loads of it; spread it over the ground; then put on 178 cart loads of stable and the cultivation of corn) was greatly defeative, as there were two rows left through different parts of the lot unmanured, which were and put on 427 cart loads of it; spread it over the ground; then put on 178 cart loads of stable and the cultivation of corn) was greatly defeative, we continued the corn of the lot unmanured to the put of the lot unmanured to the corn of the lot unmanured. the cultivation of corn) was greatly defective, yet I have ventured no innovating experiment until the last spring, and then indeed, had I listened to the advice of many of my neighbours, (in whose judgment and experience I have great confidence) I should have abandoned an experiment suggested in the useful pages of the American Farmer, by Mr. Peter Minor, of Albermarle, in regard to the cultivation of corn in double drills. The dissuasive advice of my neighbours was predicated upsages of the pages of the American Farmer, by Mr. Peter Minor, of Albermarle, in regard to the cultivation of corn in double drills. The dissuasive advice of my neighbours was predicated upsages of the pages of the pages of the lot being much better than the cultivation of corn in double drills. The dissuasive advice of my neighbours was predicated upsages and the page of my neighbours was predicated upsages. on one occasion I observed to a farmer (who had rels one bushel and three gallons of corn per remarked to me that his drilled corn never succeeded) that mine would be planted in double drills, his reply was, you are then doubling the evil—without adverting to the fact that the single and double drill modes of preparation were entirely dissimilar. Upon a lot of ground containing by actual survey four acres, one rood and 27 polysimilar. Upon a lot of ground containing by actual survey four acres, one rood and 27 polysimilar. I adopted the plan of Mr. Minor, and the two best acres. The same lot will be prepared for corn the next year, by opening deep furrows in the middle of the space between polys, I adopted the plan of Mr. Minor, and the two best acres. eight barrels per acre; a part of it had been cultivated in corn, and the balance in wheat the preceding year. As soon as the ploughing season commenced last spring, the land was laid off into furrows at the distance of seven feet, with a three three bar shear; and with a view of deepening the furrows the plough after one of the plough afte the furrows, the plough after opening one furrow, was brought back in the same-an ox-wagon, one man, and three small boys were employed for a considerable time in filling those furrows with JOHN H. TAYLOR.

JOHN H. TAYLOR.

JOHN H. TAYLOR.

JOHN H. TAYLOR.

Amongst the mountains near us, this fruit is seldom injured by frosts, because it blooms later in the season, and the product is therefore tolerably certain. With us, the trees prosper well, but they bloom so early in the season, that the fruit is very frequently destroyed in embryo by the late frosts. It is estimated that we have not any thing like a general or full crop, more than the season and the product of two acres, was thirty-six barrels, two bushels, and three gallons.

CERTIFICATION Amongst the mountains near us, this fruit is seldom injured by frosts, because it blooms later in the season, and the product is therefore tolerably certain. With us, the trees prosper well, but they bloom so early in the season, that the fruit is very frequently destroyed in embryo by the late frosts. It is estimated that we have not any thing like a general or full crop, more than one year in three or four.

JAMES M. HITE. had been filled with manure, forming a list of about two feet in width, completely covering the manure. About two thirds of the ground was planted between the 1st and 3d of May, the seed corn being placed in the valleys on each side of the list at the distance of about 3 inches apart in the same manner on the 19th of May. When the corn had attained a growth of from 4 to 6 inches, it was thinned to a distance of from 8 to 10 inches;

BENJAMIN CRIGLAS.

I was at Mr. John the premature bloom of the peach could be preacted, and saw it ter period in the season, so as to be less liable to measured; and there was ninety four barrels of be injured by the frosts, we should much oftener have this favourite fruit, and this part of the country would then be extremely well adapted to vielded twelve barrels of the homney corn. Given under my hand this 12th day of November, I will propose such a plan; and should it be either already well known, or incorrect in fact or principle, you can throw it by—and, on the con-Vol. 6 .- 15.

my instructions to the hands employed in thinning was to leave the stalks on one side opposite to the space or interval between the stalks on the Brook, I have surveyed a small lot of land other, but from inattention, or the relative position of the stalks not admitting of it, such a potential of the stalks was rarely observed. After season, which lot I find contains the quantity of Read at the last meeting of the Agricultural Society of the Valley, and by order of said Socisition of the stalks not admitting of it, such a pothered ninety-four barrels of corn the present
season, which lot I find contains the quantity of
ety, communicated for publication in the Amethinning, ten bushels of plaster was sown broad
the thrown in as there is about that quantity rican Farmer.

No. VII.

For the last ten years of my life my occupation as been that of a farmer, and my attention has at that season of the year were then employed in at that season of the year were then employed in the solution at that season of the year were then employed in the solution at that season of the year were then employed in the solution at that season of the year were then employed in the solution is that the quantity space between the double drills; some small lost by a stream passing through, as also the necessary turning.

WM. CASTLEMAN, Jr. S. K. the cultivation of corn) was greatly defective, yet cultivation; when the hoe was used, great care sive advice of my neighbours was predicated up-rately, and has produced, agreeably to the subon the generally unfavourable results of the single joined certificate of neighbouring farmers, an averdrill experiments sometimes tried, and when up age of 91 bushels and three gallons, or 18 bar-on one occasion I observed to a farmer (who had rels one bushel and three gallons of corn per result has gone far beyond my most sanguine expectation. The lot, a stiff clay soil, is somewhat undulating, and would I suppose, in the ordinary mode of cultivation, and with such a season as the last, have produced an average of seven or cultivated the next year, and will, of course, the last, have produced an average of seven or cultivated the next year, and will, of course, the dispersed over the surface; permanent corn

TO THE EDITOR OF THE AMERICAN FARMER.

The Peach, which is esteemed one of the most the manure which had been made on the farm off a parallelogram of two acres of the same. delicious fruits we cultivate, is at the same time, the preceding winter, consisting of dry straw. Given from under my hand this 12th day of No-with us, the most uncertain of any in its product.

promise to be of any service, they are at your

disposal.

Whilst examining come vines described by a man recently from Germany, I discovered one bearing grapes in all respects like most of the others in the vineyard, but apparently several weeks later in advance to maturity. I inquired the reason of this difference, and was informed that it was owing to that vine having been ingrafted on a stock of the Winter grape; and the German said, that by grafting on stocks the fruit of which ripened at different times, one could have a vineyard of the same kind of grape ripening at almost every period of the fruit-bearing season. Upon my expressing some surprise at this information, (for my knowledge in such matters is by means considerable) a gentleman who acted as interpreter between the German and myself, and vigneron, should be approached with doubt and caution. I have observed, and many other perinformed me that this remark concerning the grape, held good with regard to other fruit like wise. He mentioned the apple in particular, which is almost the only fruit which we take the trouble of propagating by grafting in this part of the country, and stated that he had known instances of the same kind of apple when ingrafted on different stocks producing and ripen-ing its fruit in different periods of the season. As he spoke of this as of a fact well known, I ascribed my want of knowledge concerning it, to ternal causes. The external causes are the tempemy ignorance on such subjects. But, six months after, in conversing with a gentleman who cultivates a large orchard of excellent apple trees, almost all of which are reared from grafts, he questioned the fact, and stated that it must be a mistake. I therefore think that if the fact be as was related to me, (and I have no reason to doubt it except this dissent to it by a man of experience) it is not so generally known, or so much attended to in the operation of ingrafting as it ought to be, tined for the next year which are now beginning to This information led me to reflect, that, if by grafting the same kind of fruit upon stocks which ripened the fruit which it originally produced at medullary canal—and they are developed pre-different seasons, we have the same kind of fruit ri-cisely when the sap ascends by these internal pened at an earlier or later period,-that then, by grafting, we may also occasion the blooming of our fruit trees to be accelerated or delayed-and the affirmative of this position appears to me, to be entirely in coincidence with the analogies and operations of nature. The sap must first be imbibed by and pass through the roots and the body of the stock, before it reaches the graft; and is it not more rational to suppose that the stock controls the graft in the supply of juices, and period of its fructification, than that the stock be-comes assimilated and subservient to the graft in these respects.

If this then be correct, the only difficulty remaining, is to find a proper stock upon which to ingraft the peach, so as sufficiently to retard its

period of blooming.

Now the time of the blooming of fruit trees bears no proportion to the time of their maturing

Is the position a correct one, that all stone fruits may be mutually ingrafted into each other

with success?

Cobbett speaks of the peach graft growing on the cherry and the plum stock, as of a fact indis-putable and notorious.—Will the peach grow upon the species of the plum and the cherry? If the peach will grow upon the plum in all its varieties, and if the prematurity of the bloom of the peach will be delayed thereby until somewhat near the time when the stock upon which by a superabundant supply of nourishment.

trary, if you should think the hints it contains it was ingrafted, would have produced its natural blossoms, then by ingrafting the peach upon the species of the wild plum, which is very late in blooming, we shall save that fruit from the destruction of frosts, and shall have peaches with as much certainty as other fruit.

You have the plan-it may be worth something

or nothing, but is at your service.

I am, Sir, Your obed't servant,

JOHN F. BREVARD.

Remarks on the above, by L. H. GIRARDIN, President of Baltimore College, to whom they were referred for a consideration of the principles of vegetable Physiology, involved in the

two different species of the same genus, or from two different genera of the same family as the stock, be such as to differ in their respective epochs of floration, the influence of the stock will not change these epochs, but the floration of each will still occur nearly at the original

In effect, causes of two different characters act on the vegetable system. 1. External causes. 2. Inrature of the atmosphere, and the influence of light. The internal causes are various-but the the 7 triangular recesses which are cut about 1 of principal is the vital force inherent in the buds an inch deep on the back and front board -In -a force by which they attract to themselves the diagram only the back part can be seen. that quantity of the vegetable blood required by their nature—this is confirmed by the two epochs at which, in vivacious plants, the sap is most vigorous—in the Spring, for the buds of the preceding year; about mid-summer, for the buds desappear.-Further the buds communicate with the roots by tracheal vessels surrounding the ducts.-This communication has been established by nature, and is more or less perfectly re

stored in the process of grafting.

It is well known that the buds of the peach tree can be transplanted on the plum tree. They are kindred plants, (Amyzdalees)-but one of the conditions required by nature, and dictated by experience, is a simultaneous or almost simultaneous circulation of the sap in the stock, and in the graft.-The difference in the floration of two grafts mentioned above, though very evident, not necessary to state in this place.

Among the very curious and interesting effects of grafting, it is acknowledged, indeed, that re tardation may in some degree be ranked-that grafted trees fall below the standard of their natural height and duration, &c.; and that, when their fruit; the fruit the latest in ripening being too vigorous a sap prevents fructification, the evil frequently the first to put forth its blossoms. We may be remedied by grafting on a stock in which must therefore, seek for stocks of a different the sap is less abundant.—This is the opinion species which bloom later.

The same writer mentions a process, which may, perhaps, be usefully applied here. "To accelerate, he says, the fructification of tardy trees, remove circularly from the trunk a piece of bark about half an inch broad, and substitute for it a piece of bark equally wide, taken from a different species of the same genus. This will form a perfect graft-and, as in every similar process, a tumour or ring will be effected. This will stop the descending sap, which will flow back to the branches, and develope the fruits

To conclude, although vegetable physiology does not appear favourable to the suggestions of the ingenious gentleman from North Carolina, yet experiments should indefatigably be made. Since the days of Bacon, we rely scarcely on any thing but patient and persevering trials— and although those trials may not produce the results immediately in view, they generally lead to other results, perhaps equally beneficial.

L. H. G.

-0-TO THE EDITOR OF THE AMERICAN FARMER.

Dear Sir,

Below are the explanation of the diagrams that sent you some time since-I have written them in as concise a manner as possible—I hope that they may be understood.

Your's respectfully, A SUBSCRIBER.

Explanation of the figures on the Charlieshope Hive.

No. 1. The hive, resting on the cleats marked No. 12. The hive is 15 inches square at the top, and only 7 inches square at the bottom. The back of the hive is two and a quarter inches shorter than the front, of course the bottom board has an inclination of 24 inches.

No. 2. A profile view of the hive, shewing

the slope of the bottom.

No. 3. The hive tilted, shewing the inside and

No. 4. The platform on which the bees alight; this platform is a continuance of the bottom

No. 5. A hole of three inches diameter on which is nailed a round piece of tin, perforated like the rose of a watering pot .- This is to give the hive air.

No. 6. The cover of the hive, with a band running around it of 3 inches in depth; covering the hive like the cover of a banbox. The upper rim raised high enough to receive the box No. 7.

No. 7. A box exactly 15 inches square, made to fit into the rim of the cover No. 6. This cover, of course, must be 151 inches, in order that it may be taken on and off with ease. The 4 dots in the centre are augre-holes of an inch diameter,

through which the bees pass into the upper box.
No. 8. The top box of the height of a common board-open at the bottom with a ventilator of perforated tin about two inches high and 3 long.

No. 9. A top view of the hive; the sticks, was, however, small as to time.—The other conditions required for the success of grafting, it is 14. They are likewise triangular and will fit in any way.

No. 10. The band of the cover-the two dots in the centre are small holes through which nails or pins are put to keep the cover on the hive; and likewise to keep the box No. 7. from being blown or knocked over.

No. 11. The entrance for the bees 23 inches wide, and 1 an inch high; a small meshed wire net must be put before this entrance every night as soon as it becomes dark, and taken off very early

in the morning.
No. 12. The cleats by which the hives are suspended.

No. 13. Scantling running the whole length of the Apiary. The cleats rest on two pieces of scantling, and the hive is thus supported between the two; the cleats that are nailed to the hive, serve to keep it steady.

No. 14. Seven triangular recesses cut about a d of an inch deep into the back and front board,

into these recesses the sticks are put.

over at the corners, and tack it at two corners lightly, to keep the muslin from shoving aside. I then turn over the half of the muslin cover and holding the hive up shake the bees into it.— When they are in I set the hive in a frame, of which I have several, and then one by one, gently put in the sticks; the bees, even if they are in the angular recesses, give way to the sticks, as they feel it pressing on them. When the sticks are in, I turn the muslin over and passing my hand gently over the top, whatever bees may have rested on the top of the sticks will move below. I now put on the cover, No. 6, and leave the hive in the frame until evening, when I put it between the scantling where it is to remain. I generally put on the box No. 7, this keeps the hive cool. Mice cannot attack my bees, neither are they liable to robberies, and if any strange bees attack them they can defend themselves to advantage, for they stand on higher ground than the assailants. The bottom being an inclined plane, facilitates the removal of every kind of excrementitious matter, such as dead nymphs and bees, and all the little particles that are usually found in a hive. Noxious vapours are carri-ed off by means of the lower and upper ventilators, and the bees never suffer from rain, the slope carrying it off. The rays of the sun too, from the receding shape of the hive, have not as much power as if the hive were straight; and lastly, as the entrance No. 11, can be closed at pleasure, the hive can be carried to a good pasture and set in a form without my fearing a sting.

There are many advantages attending this hive which the Apiarian will soon discover. If I have not made myself sufficiently clear you have but to ask questions, and I shall take pleasure in answering. I keep my empty hives within the apiary because bees neither like a warm nor a damp hive to swarm in. I'he centre of the apiary is quite cool and dry. I do not any more, rub the hives with clover and salt, or any odoriferous leaves-the bees like to go in a clean hive. I keep mine clean and smooth, they are all planed within and without, and the outside is painted. Care must be taken to have the hives painted at least 6 wonths before you want them, as bees dislike the smell of paint. My apiary is 53 feet long, 6 high from the ground to the eaves, and 10 from the ground to the centre. Three hives, as will be seen by a section of the apiary, rest between the upright joists; at the foot of each joist, on each side of the house, I have planted a honeysuckle.

For the peculiar shape of the body of the hive, both Mr. Huish and myself, are indebted to the Greeks; but the inclined floor, the suspension, and the ventilators, are exclusively my own, as well as the muslin and the board cover. I forgot to observe in the right place, that if in shaking a swarm from a tree or bush, such as a peach tree or currant bush, into the hive, any thing drop in with them either a bunch of currants, leaves, &c. all I have to do is, with a hook, to drag the nuisance to the entrance, if it be too large to come out of the door, I cut it with a knife and draw it off. An apiarian would be delighted to see with what ease the bees can roll any thing off of their

No. 15. The ventilator in the box No. 8. part floor. I have two tiers of hives, they are not well makes 5 within each joist, and as there are 8

^{*} When the lower hive is full I lift off the cover and with a scissors cut holes in the muslin exactly under the holes of the cover, the bees will pass into the upper box immediately.

OENERAL RULES FOR THE RESTORATION AND PRESERVATION OF HEALTH.

ASTHMA.

Asthma is a spasmodic disease of the organs too much exhausted. of respiration, attended with cough, difficulty of breathing, wheezing, &c.

There are two distinct species of this disorder,

tack is sometimes induced by external heat, at lular substance of the lungs. others by cold; but in either case, their sudden nary consumption, and after a long continuation, generally terminates, either in dropsy of the persons; which often lay the foundation of a breast, or an aneurism of the heart or arterial dry, convulsive asthma. system. A tremulous respiration, paralysms of the arms, and a diminution of the urinary secretion, are unfavourable symptoms.

This is one of the chronic diseases, which may peated paroxysms for almost thirty years. The usual treatment is, to bleed, during a fit, unless extreme weakness or old age should forbid the use of the lancet: to inject a purging clyster, containing a solution of asafætida: and if the violence of the symptom do not speedily abate, to apply a blistering plaster to the neck or breast. Previously to a fit, emetics have been found useful, especially when the stomach was loaded with crudities. In the intervals, lac ammoniacum, vinegar of squills, asafætida pills, and other sti-mulating and deobstruent medicines are usefully employed. Sir John declares, that a strong infu-tulency. sion of roasted coffee is the best remedy he ever experienced, to abate the paroxysms. The coffee must be of the best Moco, newly burnt, and made very strong, immediately after grinding. He or-ders an ounce to one dish, which is to be repeated after the short interval of a quarter or half an hour, and taken without milk or sugar. By the use of this remedy, he lived many years tolera-bly easy under his asthmatic complaint. Doctor particular cause. This affection may be ascer-

cation, the administration of an emetic is some. the former.

humid matter in the pectoral organs be loose, and ready for expectoration, which may be ascertained by a free rattling of the throat; 3. When respiration itself is not extremely impeded; and 4. When the patient's strength is not

On these conditions, an emetic may prove the only means of saving his life; though it may also accelerate the fatal catastrophe, especially if the each of which requires a different treatment : 1. breast be clogged with matter, and the patient When it is attended with an accumulation and possess not vigour and breath sufficient to sup-discharge of humours from the lungs, in which port the operation of an emetic. Hence a judioase it is called humid asthma; and 2. When cious practitioner will, in such cases, not hesitate

IMPORTANT DISCOVERY.

A new and expeditious method of Milking Cows.

I have had the satisfaction of witnessing, in nuity. presence of a number of gentlemen, a cow evacuating the whole of her milk by the following simple contrivance. A rye straw was introduced into the orifice of each teat, through which the milk flowed spontaneously in a full and uninterrupted stream, until the udder was completely emptied. In exactly five minutes, between 5 and 6 quarts were thus drawn off. After the straws were withdrawn the udder was collapsed and empty, and not a spoonfull of milk could be ob-tained by the efforts of the hand.

It is well known to anatomists, that the numerous milk tubes or canals are so formed as to communicate with each other, and all terminate in the extremity of the teat, and the milk is re tained by a power similar to the contraction of a sphincter muscle. The straw or any tube being introduced removes the contraction mechanically, and allows the milk to flow freely. The discovery of this novel process was reserved for a simple rustic boy in the town of Middleborough. His father, by the name of Bent, having a cow that did not yield her milk without great strength and effort, was induced to sell her to a neighbour, but she was for the same reason returned again to the original owner. The boy always dreaded the milking as a very laborious and fatiguing task, while his brother finished milking another cow in half the time. After some time, however, the boy who had the most difficult task assigned him, brought in his milk before the other. Mr. Bent inquired by what means he had finished milking sooner than usual. The boy was silent, and the secret remained undiscovered for several days, when his father accompanied him to the barn and had his curiosity fully gratified. The boy opening a box which contained a number of rye straws, one of which being introduced into each teat, the cow was speedily milked without decide as to the utility of the method." ced about half an inch, which is done with great facility, the cow discovers not the least impatience, but in withdrawing the straw, a little force is required.

Small quills made entirely smooth at the end would be preferable; but milking tubes may be made of silver or tin. and it is not improbable that those articles will soon be numbered among our indispensable utensils. The size should be a little larger than a quill from the wing of a hen. Whether the habitual employment of the tube

very important acquisition from which may be anticipated the following advantages:

in a day, 6 or 8 persons in milking—by this new method, if the tube is made of the full size of the orifice to receive it, the whole business may be greater ease to the milker and the animal.

2d. We may be relieved from the unpleasant apprehension of dirty hands employed in milk-

ing.
3d. When the udder is in an undurated or diseased state, or the teats tender and excoriated, the animal may be milked without pain.

4. Fractious kicking cows may in this way be milked with less trouble and danger.

Had this curious discovery been made by philosophers and physiologists in past ages, they might have claimed a rank with Franklin and Jenner, but the Middleborough boy is surely entitled to the public consideration for his inge-

I cannot resist the desire (if the association may be permitted,) on this occasion, to suggest another happy consequence that may result from this discovery, one in which our personal feel-

ings are more particularly interested.

JAMES THATCHER.

CULPABLE NEGLECT OF FRUIT TREES.

[It is matter of regret and surprise, yet it is obviously true, judging from their actions, that almost every Farmer thinks, with respect to his fruit trees, that he has discharged his duty, and done all that is necessary, when he has paid the Nursery Man's bill; and put the trees at certain distances in the ground, firmly enough to keep a strong northwester from blowing them downhaving done that great feat, and even that is not done by one half of our farmers, he leaves them to their fate, to work out their own salvation without ever applying plough, hoe, or pruning knife.

Now there is no animated thing in existence, whether vegetable or animal, that is not liable to disease, decay, and death; and a young tree can no more thrive, and flourish, in defiance of want of nourishment, and the assaults of disease, with-out care, assistance and protection, than a young child can. Would you have them grow, you must cultivate and manure the ground—keep the earth loose about the roots, and take off no exhausting crops from the land. If you wish them to live, you must destroy and keep off the insects that assail them, in every part; you must prune off re-dundant wood, and heal, by proper applications, the wounds inflicted by accident or the knife-and how should it be otherwise? If you leave your corn to its fate, will not the grass overrun and the birds devour it? If you leave your calf or your colt, to shift for itself, will it not perish? So it is with trees. They require to be looked after-Providence has kindly given us the seeds and the grains, but it was never heard of, that they should perfect and prepare themselves for the use of man, without any exertions of his own: and whence, pray, have we derived the notion, that pears and apples, and peaches, and all the lus-cious fruits of the climate and the season, should crown our tables and delight our palates, without the necessity of watching, cultivating and cherishing the tree, from the scion in the nursery bed, to the maturity of the full growth? That they should drop into our very mouth, without the trouble even of plucking them? it was never intended; and none but the sluggard, ignorant of the inseparable connexion between happiness and employment, would ever expect it. "And the Lord took the man, and put him into the Garden of Eden, to dress it, and to keep it." Saying "In the sweat of thy face, shalt thou eat bread,

till thou return unto the ground."

The Gooseberry, for instance, which in its native state is small and without variety of flavour or colour, has, like a thousand other fruits and flowers, been infinitely diversified and improved, by art and industry—so much so that more than fifty varieties have been imported by the brother of the writer of the following communication; oblige his visitors "with a sight of 300 varieties, the largest of which in weight was equal to three full as large as a pigeon's egg. Some will tell you, and find it a pretext for their indolence, that fine

enjoy our best fruits in perfection, to take the pains that friend Thomas has done, to preserve the lives of valuable trees. If an old horse gets cause existed in the roots, and this conjecture bethe cholic, or a cow the hollow horn, great anxiety is excited—all the old men and old women in the neighbourhood are consulted, and nostrums (July). This tree had, like several others, sudwithout number are prescribed and administered; that I are the learning from year to year and condition, and while leaded with fruit. On but if a noble tree, bearing from year to year, ant condition, and while loaded with fruit. On the most delicious and melting fruit, be taken sick—no heed is taken of it, no effort made to nothing indicated the presence of worms; there save its life—its premature decay is regarded with however, a slight difference here and there, in the appearance of the health this difference. with indifference, it is left to die without inquiring in the appearance of the bark; this difference into the cause, or an attempt to rescue it. Hence was in fact, so trivial that on any other occasion, it is, that in many parts of Maryland, and south of it, it may almost be said, of orchards of good spots, though nearly resembling bark, were in fruit, that few are planted and none flourish. fruit, that few are planted and none flourish.

and commendation of Mr. Thomas's communistance being removed I perceived that the object cation on *freach trees*, makes the following sug- of my pursuit had, contrary to the custom of the

and rural economy, embracing the management As soon as I had made this discovery, I pro-of fruit trees, I was particularly gratified to find ceeded to examine such of my trees (about a that Mr. T. had discovered the cause of a mala-dozen in number) as had previously perished, the found a remedy for the disease, he can hardly be destroyed a fine St. Germain pear tree of nearly aware of the extent of the benefaction which his six inches diameter. The graft had been insertdiscovery will bestow, not only upon 'the lovers and cultivators of fine fruit,' but upon the nume-the worm had ascended; here it took a longiturous class of orchardists throughout the country. The disease alluded to, has been hitherto con-fined to the pear trees, but this spring has made its appearance in the apple orchards of this part of this state. In my own orchards it has been confined to the blasting of a small proportion of the smaller limbs of a few trees, but I am informed, in another part of the county, it has nearly destroyed a whole orchard of young apple trees. I hope therefore Mr. Thomas will communicate as soon as possible, his discoveries upon this sub-

CAUSES OF THE PREMATURE AND SUDDEN DECAY OF PEAR AND APPLE TREES.

Baltimore, 6th Mo. 10, 1824.

relative to the insect which assails with such fa | trees: this conjecture was also upon inspection veand an English nursery man has been known to tal effect the roots of the peach tree, and at the same time pointed out a simple, but efficacious ed worms, resembling in every respect those found method of resisting its attacks. I shall now in as in the pear trees, from which I infer that they atguineas and an half," we have just seen some of brief a manner as I can consistently with the sub-tack indiscriminately both the pear and apple trees, superb quality from the country residence of Maj. Ject on which I am about to treat, disclose the which is not surprising, considering their very M'Kim, our faithful representative in Congress, result of my researches into the causes of the near resemblance to each other. Here was a saresult of my researches into the causes of the near resemblance to each other. Here was a sapremature and sudden decay of pear and apple disfactory solution of the difficulty which had trees What is called the blast in pear trees has perplexed our cultivators respecting the cause fruit costs more than it comes to, and that money will always fetch it from the market; but all the Gold of Ophir will not bring it there, without the requisite skill, patience and industry, to rear and perfect it. Besides even those most able to purchase the luxury of fine fruit are often denied means a theorem in pear trees has perplexed our cultivators respecting the cause of the premature decay of their apple trees, and of the defectiveness of the fruit. Although the apple tree when injured by worms to be a phenomenon wholly inexplicable to some, of the premature decay of their apple trees, and of the defectiveness of the defectiveness of the defectiveness of the defectiveness of the absurd notion that it was the effect of electrical through the apple tree when injured by worms to be a phenomenon wholly inexplicable to some, of the premature decay of their apple trees, and of the defectiveness o purchase the luxury of fine fruit, are often denied it by their distance from market, as well as by as soon as I should have sufficient leisure for the their ignoble want of diligence to provide it for purpose. This did not occur until the last sum themselves. Among the Chinese, whom we after the meantime however, I had adopted violet blue wings, and is somewhat larger than the

fect to despise, so great is their attention to hor- the expedient of amputating the blighted limbs ticultural pursuits, that a peasant whose garden as soon as they appeared, considering the disease or fields are cultivated with the most care is rewarded by being made a Mandarin of his class. A moment given to just reflections of this nasome of my trees perished and others suffered so ture, would reconcile every one who desires to severely, that I was induced to cut them off al-We will only for the present give the following extract from a valued correspondent in Virginia, who, after speaking in terms of thankfulness for, had excavated in the tree. This factitious subgestions, which go to show how desirable is the peach worm, taken an upward direction; having best practical information as to apples and pears ascended about a foot from the ground it was as"Having for many years of my life given my attention to that branch of the subject of domestic taking its flight.

dy which had entirely eluded all my researches. result was that every one of these had been killed had if in the discovery of the cause, he has also by worms! In one instance a single worm had dinal direction, cutting a deep groove quite round the tree, by which all the sap vessels were com-pletely divided, and the communication cut off between the lower and upper parts of the tree. In the surviving trees that had suffered in a

greater or less degree, the extent of the blight was found to correspond with the injury received at the root. In one tree for instance, one half of the limbs perished, while the other half sustain-ed a load of fine and perfect fruit. On examination it was found that the worms had destroyed all the alburnum on one side near the root-on another tree one limb only perished, while the rest looked uncommonly healthy and bore perfect and delicious fruit-two worms only had entered this tree. In a word, one of the causes, at least of the premature and sudden decay of pear trees

was rendered indubitably evident. Having removed the worms from such of my trees as contained them, and secured them from RESPECTED FRIEND,
In a former letter I communicated some facts that a similar cause might exist in the apple rified, for I found that nearly all my trees contain-

the ground free from weeds, is all the care requirage for this year. In November, this shoot is again to be covered as before directed, and in the RAL WASHINGTON lived to this day, I would be gaining one season, or year, by planting out the cuttings in the autumn; again to be covered as before directed, and in the RAL WASHINGTON lived to this day, I would be gaining one season, or year, by planting out the cuttings in the autumn; and the value at least four times as much annustrongest should be rubbed off, and that support-occasionally displaying them at a festive board, all also take this opportunity to mention that I also take this opportunity to mention that I believe it would be gaining one season, or year, by planting out the cuttings in the autumn; and the value at least four times as much annustrongest should be rubbed off, and that support-occasionally displaying them at a festive board, all. above the second lowest clasper; that is, leaving on two eyes to shoot this season, and again rubbing off all the eyes below the lowest clasper.

Both these shoots should be permitted to grow to their utmost length; which, if the soil be favore their utmost length; which, if the soil be favore their utmost length; which, if the soil be favore their utmost length; which, if the soil be favore their utmost length; which, if the soil be favore to him. One thing that tacket yet, yard, as the growth will be so much the more above the second lowest clasper; that is, leaving the world from a political vigorous. And to shew you I am not singular in that after saving the world from a political vigorous. And to shew you I am not singular in this opinion, I give you the following extract of a letter to me, from Mr. Prince, of the Linneau Garden, &c. near New-York. And from the lineau like and the second lowest clasper. able, will be considerable, and there will be reason to hope for fruit the next season."

In the third February cutting, three eyes upon each shoot may be left on, and not more, however strong the shoots may be. From this time and how high do you train them from the ground? "those set out in the Spring: cuttings planted in forward, all the side branches from the shoots of the year are to be rubbed off, taking great care nished me with the following very satisfactory of a fibrous root, and the fine roots push from not to injure the leaf from whence they spring, answers: which is the nurse of the bud at the root of its "The

"At the fourth time of cutting the vine, and from that time forward, it may be cut about the last of October; four eyes on each shoot may be left; and at the fifth cutting five eyes on each shoot may be left on, but more than five eyes on a shoot, ought not to be left on, even in the most vigorous state of growth, at any age of the vine; for however pleasing the increase for the year "none less. I have planted the vines four feet style of living. Therefore, every one knowing may be, the injury thereby done to the vine, will "apart each way, which admits about 2700 to how he stands in these two respects, the best be seen and lamented in the following, and pro-

bably many succeeding years." " If it be enquired why a single is recommended, rather than a cutting of sixteen inches long, it is replied, that roots shooting from a single eye, exclusively from itself, are much the strongest, and strike more directly downward; the shoot and strike more directly downward; the shoot "If we count three cuttings, at three cents each; there, and then, they are paid back their rent from it has less pith in it, the wood is firmer and shorter jointed, and comes sooner into full bearing; and appears to be much the most healthy wine. And to these important advantages may be truly added, that a thousand plants, fit to set out, "offered the rent, is acquainted with the busiwithin less space, either in a hot bed, or in the open ground, than a hundred plants can be raised from long cuttings; which have not, that I know of, one single advantage in their favour; and, in a new country, it is of no small consideration that the same cuttings will produce five times the number of plants."

" As to the manner of accommodating your vine to its situation, an active imagination would sug-

"It is at the first trimming of the vine, that we try shall feel the advantage or necessity of raisbegin to apply the principle above laid down, and ing vineyards for a supply of wine within our different; he plants more than four times as it is here only that there ever can be any difficulty can like the many vines on the same space of ground that I in the application of it; and this difficulty can will lead them into the practice, in the only way only arise from the very feeble growth of the vine, in which we can hope for speedy success. And I teach us; and it will take several years to decide; as not to have produced a clasper in any part of it, pledge myself to you, that whether you immershich will seldom happen: the vine must be cut diately succeed or not, you shall derive a pleasible, and that in the course of a few years, a off at half an inch above the lowest strong full sure from the attempt itself, that shall amply savineyard will be considered as necessary an apsye; otherwise it must be cut half an inch above tisfy you for every expense, of money or time, it the first clasper, and in both cases all the eyes shall cost you. Sporting with the long branches, for there can be more wine made off the same below are to be carefully rubbed off."

"The eye thus left on will sometimes produce more than one shoot, in which case all but the growth of the fine clusters from the upper cider in twelve years from an apple or peach orchard; the fine clusters from the upper cider in twelve years from an apple or chard; the state of the same bending them in this way may be preserved, and and the value at least four times as much annumentation.

Indeed the cheese, and groceries, comes fruit. the Borough-mongers have hawned half his in-people would not eat it, which is the best secu-come, and they will have it, or his blood. He rity against its being made. Mind, I state diswishes to escape from this alternative. He wishes to keep his blood, and enjoy his money too. the best, was of American produce. I know the had high boards on the sides of the wagon, and his He would come to America; but he does not article well. Bread and cheese dinners have know, whether prices here will not make up for the robbery of the Borough-villains; and he know the Cheshire, Gloucester, Wiltshire, Stil wishes to know, too, what sort of society he is ton, and I never tasted betgoing into. Of the latter I will speak in the ter than American cheese, bought of Mr. STICK-next Chapter.

LER, in Broad-Street, New-York. And, in-332. The price of house-rent and fuel is, any deed, why should it not be thus in a country where at more than three miles from New York, where the pasture is so rich; where the sun as low as it is at the same distance from any warms every thing into sweetness; where the great city or town in England. The price of cattle eat the grass close under the shade of wheaten bread is a third lower than it is in any the thickest trees, which we know well they will part of England. The price of beef, mutton, not do in England? Take any fruit which has a room, for five months in the year. As a sauce lamb, veal, small pork, hog meat, poultry, is one grown in the shade in England, and you will find to venison or mutton, they are as good as currant half the London price, the first is as good, the that it has not half the sweetness in it, that there jelly. Pine apples in abundance, for several

sions at a price double of that which the Ameri-

the owner would not permit; and he sold the that one wonders how it can be brought to mar-Ox on that condition. I need hardly say that the ket for the money. Fine Black-rock, as good, at duty laid on the importation, the absence of taxes owner was a Quaker. New Jersey had the holeast, as Codfish, I have seen sold, and in cold and the cheap food and drink enable the retailer our doors, at an English three pence a pound. believe they count fifty or sixty sorts of fish in New-York market, as the average. Oysters, most years, sent to England, finer than any that other shell-fish, called Clams. In short, the variety and abundance are such that I cannot

sheep's head and filuck. It is seldom that Oxes' breach of covenants after being suffered to esheep's head and filuck. It is seldom that Oxes' breach of covenants after being suffered to esheeds are used at home, or sold, and never in the cape with only a gentle squeeze.

341. Household Furniture all cheaper than in country-house without these conveniences, may buy butter, cheaper, and, upon an average, heads are used at home, or sold, and never in the better than in England. The garden stuff it he send to New York for it, he must buy pretty calves' heads, large bits, and whole joints of England. Mahogany timber a third part of the meat, are left on the shambles at New-York, for English price. The distance shorter to bring it, and the tax next to nothing on importation. The

pears, cherries, peaches at a tenth part of the English price. The other day I met a man going wagon held about 40 or 50 bushels. I have bought very good apples this year for four hence half-henny (English) a bushel to boil for little pigs. Besides these, strawberries grow wild in abundance; but no one would take the trouble to get them. Huckleberries in the woods in great abundance, chesnuts all over the country. Four pence half penny (English) a quart for these lat-ter. Cranberries, the finest fruit for tarts that ever grew, are bought for about a dollar a bushel, and they will keep, flung down in the corner of

339. I am afraid to speak of drink, lest I should whole, thirty-eight hounds, had five hounds of loose fat, and three hounds and ten ounces of suet. Tea, sugar, coffee, spices, chocolate, We cut a pound of solid fat from each breast, cocoa, salt, sweet oil: all free of the borough-We cut a pound of solid fat from each breast, cocoa, salt, sweet oil: all free of the borough-conclusion, I proceed to inform those, who are and, after that it was too fat to be pleasant to mongers' taxes and their shawn, are so cheap as not content with the Cow for vintner and breweat. My flock being very small, forty, or there to be within the reach of every one. Chocolate er, that all the materials for making people abouts, of some neighbours joined them; and which is a treat to the rich, in England, is here drunk, or muddle headed are much cheaper here they have all got fat together. I have missed the interlopers lately. I suppose the "York-ters" have eaten them up by this time. What they have fattened on except brambles and cetary have fattened o yourself, in the country, and it is about seven English hence a gallon; that is to say, less than two hence a quart. No Boroughmonger's tax on mon spirits of the country are about three shillings and six pence (English) a gallon. Come on, then, if you love toping; for here you may drink yourselves blind at the price of six pence.

340. Wearing appared comes chiefly from

England, and all the materials of dress are as cheap as they are there; for, though there is a weather too, at an English farthing a found, to sell as low here as there. Shoes are cheaper They now bring us fine fish round the country to than in England; for though shoe makers are well paid for their labour, there is no boroughvillain to tax the leather. All the India and French goods are at half the English price. Here no ruffian can seize you by the throat and tear off your suspected handkerchief. Here Sig-NOR WAITHMAN, or any body in that line, might

will not have some planted and preserved. any body to take away that will. They general and the tax next to nothing on importation. The 334. Cheese, of Cheshire in Massachusetts, I ly fall to the share of the street hogs, a thousand woods here, the pine, the ash, the white oak, the

money,) which is much lower than even mid-dling cheese in England. Perhaps, generally Oh! no! if it were not for the superabundance saw a rift in this country. The hackney coach speaking, the cheese here is not so good as the all the good would be sold at some price or other. horses, and the coaches themselves, at New-better kings in England; but, there is none here 338. After bread, flesh, fish, fowl, butter, York, bear no resemblance to things of the same

by the month. This is what they, in fact do in England; for there they can quit at a month's find here. Make the best selection you can. The man will not wear a livery, any Give good wages, not too much work, and remove than he will wear a halter round his neck. Solve, at all events, to treat them with civility.

Woolly Holcus.

Meadow soft graze:

Avena lanata.

White timothy. This is no great matter; for as your neighbour's and the maid servant, the objection, the rooted aversion to the name, seems to bespeak a mixture no people that laboured for other people; but, selves to another set, deriving their authority serts the same of the hay made out of it. Lass man is always trying to throw the working part off his own shoulders, as we see by the conduct of priests in all ages, negroes were soon inproperty prostrate beneath the hoof of an inso-the richest to the poorest. part off his own shoulders, as we see by the couldert of his own should on the his own should be a supplied to other men their slaves; and, therefore, "for curse, what need you ca more grace," as Master Matthew says in the play, they called their slaves servants. But, 345. However, as the though I doubt not that this device was quite one and the same thing, a conclusion perfectly natural and directly deducible from the premises. superiors in life, who, without the smallest ap-parent reluctance, call themselves "Public Ser- I would rather recommend, hang himself at once. vants," in imitation, I suppose, of English Ministers and his Holiness, the Pope, who, in the excess of his humility, calls himself, "the Servant of the Servants of the Lord." But, perhaps, BOTANICAL SKETCH of the principal gramina use the American Domestics have observed, that " Public Servant" really means master. Be the though they still keep a civil tongue in their head, there is not one of them that will not resent the affront with more bitterness than any other that you can offer. The man, therefore, who would deliberately offer such an affront must be a fool. But, there is an inconvenience far greater than this. People in general, are so comfortably situated, that very few, and those who are not pushed hard will become domeses and comfort of families. What a difference would it make in this country, if it could be supplied with nice, clean, dutiful, English maid servants! As to the men, it does not much signify; are hairy—and the spikelets have only one awn. This plant grows from Canada has a short awn—the male flower a long, twisted, to Virginia.

11. Holcus Alepensis. Lin. Holcus of Aleppo.

12. This plant grows from Canada has a short awn—the male flower a long, twisted, to Virginia.

and the horses for the dogs.

343. Domestic Servants! This is a weighty article: not in the cost, however, so much as in the plague. A good man servant is worth thrity hounds sterling a year; and a good woman servant, twenty hounds sterling a year. But, this is not all; for, in the first place they will hire only be month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they, in fact do in the month. This is what they in fact do in the month. This is what they in fact do in the month. This is what they in fact do in the month. This is what they in fact do in the month. This is what they in fact do in the month with the month in the month you must turn ments mentioned by Humphry Davy—to whose they will you. If, by any change in the month, you must turn ments mentioned by Humphry Davy—to whose they have been here a month, you must turn deprivation. If, by any change is the month will be in the month before the ship gets on soundings; and, before matter which it affords, according to the experiments mentioned by Humphry Davy—to whose deprivation in the cost, however, so much as in the month you must turn ments mentioned by Humphry Davy—to whose deprivation in the cost, however, so much a serior which it affords, according to the experiments and the month you must turn agricultural chemistry the reader is referred for them out of doors, or they will you. If, by any change is the month you cannot. If the month it affords, according to the experiments and the month you must turn agricultural chemistry the reader is referred for them here, it may do; but on you cannot. If the month it is afforded in the month is a fact of the experiments and the properties and the properties

344. However, what is this plague, compared with that of the tax-gatherer? What is this men are of the same taste, you expose yourself to with that of the tax-gatherer? What is this no humiliation on this score. Neither men nor plague, compared with the constant sight of begwomen will allow you to call them servants, and the constant sight of beg-they will take especial care not to call themselves coming a pauper or beggar yourself? If your by that name. This seems something very capricious, at the least; and, as people in such situations of life, really are servants commands. tuations of life, really are servants, according to mand you. You are not ordered to "stand and even the sense which Moses gives to the word, deliver" twenty or thirty times in the year by when he forbids the working of the man servant, the insolent agent of Boroughmongers. No one comes to forbid you to open or shut up a window. No insolent set of Commissioners send of false pride and of insolence, neither of which their orders for you to dance attendance on belong to the American character, even in the lowest walks of life. I will, therefore, explain the cause of this dislike of the name of servant. on your oath, make you pay the tax, laugh in agricultural chemistry) says that it appears to be When this country was first settled, there were your face, and leave you an appeal from themno people that laboured for other people; but, selves to another, set, deriving their authority serts the same of the hay made out of it.

345. However, as there are some men, and some women, who can never be at hearts' ease, efficient in quieting their own consciences, it gave unless they have the power of domineering over rise to the notion, that slave and servant meant somebody or other, and who will rather be slaves themselves than not have it in their power to treat others as slaves, it becomes a man of for-Hence every free man and woman have rejected tune, proposing to emigrate to America, to conwith just disdain the appellation of servant. sider soberly, whether he, or his wife, be of this with just disdain the appellation of servant. sider soberly, whether he, or his wife, be of this One would think, however, that they might be taste; and, if the result of his consideration be reconciled to it by the conduct of some of their in the affirmative, his best way will be to conti-

ful, or likely to become useful, in husbandry.

printed variety e.)

some French Botanists.

This plant, a native of Europe, is also placed 10. Holcus laxus. Lin. \ Loose flowering holcus. Muhlenberg and others, among our indigenous by Muhlenberg and others, among our indigenous gramina. It has been removed from the genus avena among the Holci, on account of its male and has the aspect of Melica carulea. Its cuim is two who are not pushed hard will become domestics to any body. So that, generally speaking, domestics of both sexes are far from good. They are honest, but they are not obedient. They are careless. Wanting frequently in the greater part of those qualities, which make their services conducive to the neatness of hous. The honest their services conducive to the neatness of hous. The honest are not observed as their services conducive to the neatness of hous. The honest are fibrous, feet high—slender—rather bending—the leaves are numerous smooth at the surface—but rough at their edges. The orifice of the sheath is villated—about 1 inch broad. The panicle is long, lose. The panicle is capillary—with few ramifications, and an inclined aspect. The male flower their services conducive to the neatness of hous. The hermaphrodite flower is valued to Viscipia.

name in London. The former are all good, absence of grinding taxation, can compensate thrives best on strong, tenacious clay. It is not sound, clean and handsome. What the latter are, I need describe in no other way than to say, project as it would be to try to carry the suncularly, eat it with apparent reluctance—probathat the coaches seem fit for nothing but the fire, before the ship gots on coundings; and before matter which it affords according to the same

This plant is indigenous both in Europe and in America. It is very common in meadows, where its general aspect renders it conspicuous. Its stalks are villose, about one foot and a half or two feet high-straight-and terminated by a diffuse or expanded panicle—of a whitish or light purple colour—and apparently covered with cotton. Each corolla contains an awnless fertile flower—and a sterile one, armed with an awn, bent in the form of a hook. The glumes are vil-lose. The plant is perennial, and flowers in June and July.

This plant is a native of Europe-commonly found there in dry places. It is perennial, and flowers in July and August. Its stalks are about 11 foot high, geniculated, and hairy at the joints. The panicle smaller and less tomentose than in H. Lanatus-of a sallow white colour mixed with violet or purple tints. The glumes invest 2 flowers-the one generally male, with a pedicel, and a long awn at its tip-the other hermaphrodite and awnless.

This is one of the best grasses. It affords a considerable quantity of nutritive matter when in bloom, and makes excellent hay.

9. Holcus striatus. LIN. Striated holcus. to be an Aira.

I notice this species because indigenous. It was first made known by Clayton, who found it in the swamps of Virginia. The leaves are flat, cause what it may, however, they continue most obstinately to scout the name of servant; and, (N. B. In the last No. variety y was erroneously long, with a sheath rather thick and striated. The panicle is close, oblong, pyramidal, with very short, dense, and branching pedicels. The 6. Holcus avenaceus. Schr. | Tall oat grass. | very short, dense, and branching pediceis. The Avena elatior. | Lin. | The Fromental of glumes, which contain two flowers, are striated, mutic, and acuminate.

This species is also mentioned by Clayton. It

are at least 2 feet long, and more than one inch broad—smooth—green—longitudinally marked with a white line. The panicle is ample, terminal—loose—of a reddish colour. The hermaphrodite flowers are generally awned—the male flowers awnless. There are 3 or 4 varieties of this plant which has a perennial root. Holcus decolorans and Holeus nitidus have great affinities with it.

It is proper to mention the Holcus compactus, to which the Holcus cernuus of Muhlenberg, cultivated in gardens, and flowering in August and September, bears so great a resemblance as to two plants to be of the same species. The Holeus cernuus is easily recognized by the appearance of its panicle, twisted in its incipient state, and afterwards inclined or pendulous—and by the flat, striated, shorter than the control of the search and the state of the state lenticular form of its seeds, spotted with red. It goes, as well as the H. Saccharatus, under the vulgar name of Broom-corn. The milium nigricans, used in Peru as an article of diet, is a Sorghum or Holcus, &c.

such as Holcus spicatus, H. bicolor, &c. seem to have lately excited a considerable degree of at-Egypt, India, &c. had long since furnished a ed here only on account of its sin large bouquet of Holci. Of late, the Cape of ing acquainted with its qualities. Good-Hope, New-Holland, South America, &c. have greatly added to that bouquet-and several species might probably be naturalized with advantage in the United States. From the little I The culm of this species is 3 feet high—delitiguing exercise, when the fibres of the digestive have remarked respecting the laceration of this cate—with smooth, and verdant leaves—about 1 organs are already weakened, and the circulation organs are already weakened, and the circulation genus by the moderns, it will be inferred, perhaps, that botany is yet in a vague, confuse state. The inference would be erroneous. Even the large groups of Linnaus are of infinite utility—but the discerning eye, the indefatigable diligence, the microscopic accuracy of modern investigators aim at something still more satisfactory. They have observed chasms, and they wish to fill them up. To present all the families, genera, and species of plants in their true natural order—to group them strictly according to their affinities—and to supply all the links of the immense and splendid.

To present all the families, genera, and species of plants in their true natural order—to group them strictly according to their affinities—and to supply all the links of the immense and splendid.

Twin-spiked

Millium distichum. Muhl. Twin-spiked

Millium distichum. Muhl. Twin-spiked chain of vegetable existences, is the commendable object which they have in view, and which from the laudable and characteristic ardour of the age after natural knowledge will, no doubt, be accomplished at no very distant day.

I now pass to the genus. Milium Millet. (Triandria-Digynia.) S Mil-petit mil. (Milium from Mille, a thousand, on account of

the great number of the seeds in this plant.)
I It must already have struck the reader that the vulgar name MILLET is extremely vague.-We have seen it already given to several species Under the genus Agrostis, a few other species few persons in common life possess: on the other of Holcus: it is also applied to milium, a genus formerly ranked under Milium, will be described. hand, the administration of a simple emetic may so nearly allied to Agrostis as to have been united therewith by Lamark, and other modern Botanists-some species of Milium have also been in corporated with the genus Panicum. The Pani cum italicum, and Panicum Miliaceum, were the 2 principal species of Millet used by the ancients for making bread. Great confusion must unavoidably prevail in respect to Millet, until all the plants indiscriminately grouped by the imagination under that name, be accurately distinguished.

The generic characters of Milium, are a 2 valved nearly ventricose calyx, valves upequal

France. The stalks are of the size of the little two very short valves, with or without an awn. pursue the gratifications of sense. In the prefinger, and rise from 2 to 6 feet. The leaves Stigmas plumose or villous. Flowers paniculate sent instance, however, we shall confine its mean-

I will describe only a few species.

the light sandy fields of New Jersey, near Egg-harbour, where it flowers in July and August. Its singularity consists in having only male flowers in a panicle at its top, and female flowers, and, consequently, the fruit at the extremity of scapi or have induced some Botanists to pronounce these naked stems about the root, and even under as well with the most simple as the most com-

striated, shorter than the parts of the culm be-tween the joints, covered with long, whitish, rough hairs, tuberous at their insertion. The mind and body, from a simple and frugal diet. sheaths are round, striated, hairy like the leaves; the upper one has no limb extending from the hypochondriac, and the tipler; all may be rankful or Holcus, &c.

Thus much for a genus some species of which, and the bears only a few flowers, which are all to add, in this place, any other remark, than that male—its ramifications are simple. The glums such an inclination for sensual enjoyment remains are oblong, acute, nerved, equal, pretty smooth. only so long as the operation of these exquisite tention in the southern states. The inquisitive agriculturist will not, however, comine himself to these outlines and hints—he will recur, for ample and recent information, to the works of the mature seeds, which are large and round, penelatest and most approved Botanists, with which trate into the soil below. Purch has given a lindigestion. latest and most approved Botanists, with which trate into the soil below. ture, and has seldom failed to be of service to to phlegmatick or corpulent individuals, when continued for several mornings. But if there appear to be great fullness of the stomach, or bowels, attended with the symptoms before described, it will sometimes be necessary to give such an emetic as may according to circumstant. such an emetic as may, according to circumstances, at the same time relieve the bowels. A mixture of two parts of ipecacuanha wine, and one part of antimonial wine taken in single teaspoonfuls every quarter of an hour, without any farther drink till it begins to operate, generally produces the desired effect.

After the stomach and bowels have, by such or similar means, been evacuated, it will be useful to strengthen the tone of the fibres, by drinking small draughts of chamomile tea, or an infusion of quassia, or simple toast and water well prepared, which last may be justly considered as one Am. Far.] of the mildest and most grateful corroborants.

An insatiable appetite may arise from too great a distension of the stomach in early infancy; great a distension of the stomach in early interest, from an over-abundant secretion of the gastric or digestive liquor; from drinking large quanti- I have often thought of writing to you on the subject of raising Irish potatoes from the apples on the vines of Irish potatoes. In bad habit of fast eating, w thout properly masti-cating hard substances. Hence the first maxim in diet should be, to eat slowly, in order to prevent a sudden distension of the digestive organs, and to allow sufficient time for the food to be duy prepared, and gradually mixed with the gasric juice. It would be superfluous to add any other suggestions respecting the treatment and

TO THE EDITOR OF THE AMERICAN FARMER.

TO MAKE CURRANT WINE.

Steubenville, June 20th, 1824.

DEAR SIR,-The appearance of the currants ripening reminds me of your request, to have the receipt by which the wine was made, that you did me the honor to speak so highly of.

Wash your currants and strain off the juice through a flannel bag; to every gallon of juice, add three gallons of soft water, and to every galon of the mixture, add three pounds of Orleans sagar, and half a pint of French brandy-fill thin rag, to prevent flies from getting in—as soon is the fermentation is over, bung the cask up to inform me if you can—how I am to preserve these apples through the winter from frost and the year, when it may be either bottled up, or trawn on tap. The only material difference in a favour on rawn on tap. The only material difference in a favour on he above and many other receipts is the addition the brandy before fermentation takes place; pon which I think the goodness of the wine in a eat measure depends; usually the brandy is aded after the fermentation is over as is the cusom in making grape wine. I had observed that arrant wine had generally an acetous smell and ot unfrequently an acetous taste, which I thought as owing to the fermentation having proceeded ast the vinous point, for want of a sufficient spigentle iseating ice, the

as still a very slight fermentation was carried as chamber lye, applied twice in March, and

cold, wind generally north, frequent frosts during this month, so as to make fire necessary morning and evenings. Our crops of small grain look well generally, and promise an abundant harvest; crops of grass will be unusually heavy; Indian corn is backward, owing to the cold wea-ther, but I hope there is a sufficiency of hot suns

in store for us to make a good crop yet.

With the highest esteem, I remain your friend, JOHN M'DOWELL, Jr.

The current wine made after the above recipe is amongst the very best we have ever seen .- Ed.

RAISING POTATOES FROM THE APPLES.

which grow on the vines of Irish potatoes. In 1822, I planted a few apples, the drought being great I only raised 7 small potatoes about as large as my little finger end—I planted them in 1823, and raised about 2 quarts, which I planted this year, they seem to grow well. In 1823, I likewise planted a quart of apples, of which only about five hills came up; from them I raised about 3 quarts, they were numerous in the hill. These cure of this troublesome complaint, which in the present times of frugality, cannot fail to find its own remedy.

quarts, they were numerous in the lift. I likewise planted with the produce of 1822, and all promise fair for a crop. Those I planted in 1823, were in the ground from the 7th of April quarts, they were numerous in the hill. These to the 1st of October, and I found them far different from the common potato. I digged some of the common potato yesterday, and they have sprouts from the eyes the length of my finger, but those I raised had not the appearance of a sprout from them, from April to October; which is a plain instance of the genuineness of these potoes, and the great utility of raising them.

A gentleman in Ireland, who lived within a mile of my father's, raised potatoes from the ap-ples—they were a round white potato, most delicious-the next year he raised a second parcel, they were a pale red but the same shape-these two kinds of potatoes were discriminated through the whole neighbourhood, and none but them bent: when the fermentation is going on every were planted at the time I left Ireland. I have ment; when the fermentation is going on, every were planted at the time I left Ireland. I have morning fill up the cask with cold water, that he froth and impurities may work out of the time froth and impurities may work out of the line in the prospect of seed enough for my own use; the froth and impurities may work out of the line in the prospect of seed enough for my own use; bung hole, which may be lightly covered with a tinue the practice of raising potatoes in this way

Your humble servant, JAMES PURSLEY.

Editorial Correspondence.

powder of ipecacuanha, in the smallest doses of a quarter or sixth part of a grain, in a little cold water, repeated every ten minutes for two or three hours together, before breakfast, stands eminently recommended in disorders of this nature and has relden feiled to be a fearning to the cask of the cask after several years experience, he has found nothing to have so salutary and lasting an effect, twice in November, around the roots; in quantity, from a pint to a quart each time.

> China Grove, S. C. 27th June, 1824. "The prospects of the cotton crops are at this time unusually fine in this state, and owing to the very low price of all kind of provisions, there is at least one fourth more cotton planted than com-mon. It is too early yet, to know whether the rot will attack the cotton, should it escape that destructive disease, there is every reason to ex-pect a very abundant crop."

Respectfully, &c.
J. DOZIER.

Washington, Pa. July 2, 1824.

DEAR SIR,

With us the present prospects of the farmer may be considered good. Our wheat crop is fine; rye not quite so good; barley fine; owing to too much rain in June, a considerable portion of our oats are lodged; the crop will still be large.—
The frequent rains have prevented our corn from being so well worked as it should have been. It is short, but a good colour, and growing finely the last ten cays. Our grass crops are unusually heavy. The clover fields exceed any thing I have seen. The white clover appears to be again resuming its place in our pasture grounds.

Although we had several severe white frosts the last of May and early in June, we will have an abundance of both apples and peaches; we lost most of our grapes, beans, early cucumbers,

June was very changeable. It rained on sixteen day's out of the thirty. The Thermometer ranged from 42 to 90°, medium temperature at 2 o'clock was 73 1-10°. The depth of rain that fell was 5\(\frac{3}{4}\) inches, medium temperature of May was 62 1-3°. The rain gauge on the weighing plan answers well—the whole cost did not exceed two

Natural History.

ICH THYOLOGY.

DEAR SIR,

I send you herewith a small phial just received from the honorable J. S. Spence, member of Congress from Worcester county of this state, containing a few of the insects which have of late county. What gives them practical consequence is the fact that they enter the mouths of fish you reier, seem to prey upon dead ones.

Caught in gill nets, and devour every particle of their meat, without breaking the skin—so that when the fisherman flatters himself with having others, which they devour? the numbers that entering the skin and the skin which they devour? the numbers that entering the skin which they devour? taken a mess of fine fish, he finds himself deceived by a bloated exterior containing nothing but culars. bones and water. This pest is said to have made its appearance only since the time of a tremendone of their inlets on the coast; and is therefore before the cy mothoa can penetrate them. associated in the minds of the people as connected in some particular manner with that occurrence. In the narrative of Capt. Parry's late voyage of discovery, an account is given of an insect called by them the sea louse, which stripped the flesh completely from the bones of ducks, which had been confined within their reach un DEAR SIR, der the ice. The hint was improved by those on it has been because it was new to

40 tons burthen through that outlet. It was, I think, in the second winter after this event that the lating to the farmers of the neighborhood, who subjects of this correspondence were first observ- are intelligent, and incapable of misrepresenting ed. They appeared in as great numbers in that season, as they have ever done since. I assure you that I have seen thousands of them drawn in with one small gill-net. Our fishermen at this period apprehended nothing less than that they had billeted themselves upon them for that and perhaps all future years. Instead of this as the warm weather approached they disappeared, and in the month of May, not one was to be seen.

This has been their round from that time to the present, with perhaps the difference of their leaving us in subsequent years at an earlier period. It is singularly surprising that these depredators make war upon us alone, who are in the immediate vicinity of the out let to the ocean. Notwithstanding the sound extends for many miles, both north and south of this place, not one of our vermin, so far as I have been informed, has been seen five miles distant on either side from their immediate path to the sea. The rascals either require the regular kiss of the ocean tide, or like some most distinguished generals, so manage their concerns, as to reserve a safe and speedy retreat. I pretend not to question the correct ness of your correspondents with respect to the name of these creatures, nor the genus to which they refer them; but I must be permitted to observe that so far as our disagreeable acquaintance with them has extended, no fact has occurred in connexion with their habits, which would make them in any degree parasitical. They are suffi-ciently active, judicious, and voracious, to be independent of all protection, save that which is afforded by the waters and their bed. They are never found attached to fish, but for their destruction. They attack all the varieties of fish, which are taken by the nets during the season of their visit. When full, or when the temperature is so low as to render them stiff and inactive, they bury themselves in the sand and await more propitious circumstances for carrying on their war-fare. The greater portion of those I sent you were taken from the sand during a run of low tides, and were first discovered by a small aperture, through which the air was admitted, and escaped. The mode of their attack varies with the subject of it, and their own numbers. The tender skin of the herring is assailed it would seem at the first point with which they come in contact, while the rock or striped bass, and black or hard perch, are entered by the mouth; or if this opening will not readily admit the greedy swarm, they with almost equal facility enter the latter fish at the lower opening, or vent. Not only the dead, but the living, when once securely meshed, are fallen upon and devoured. I have seen these monsters feeding upon them whilst still struggling for existence.

I will add nothing further to this already fa-tiguing note, than the expression of the promise to forward to you as soon as practicable in the ensuing year, a skin, either partially or entirely excavated, with a portion of the agents which have effected the work. You will doubtless submit them to the inspection of your New York correspondent. It is not possible for me to answer the inquiry of that gentleman with regard to the number of our animals which enter the fish, nor the time required for their destruction, as the first constantly varies, and the last depends upon it. We get very few if any fish at that season, except of the species above mentioned.

We are perfectly familiar here with the parasite mentioned by Professor Say. The oniscus progustator. I have seen the mossbankers and

AGRICULTURE.

FROM THE NEW ENGLAND FARMER.

[The following observations on Sheep, we have been assured are from the pen of a person who has possessed advantages for obtaining a know ledge of the subject of his essay of a very superior Lature. The Essay itself appears to indicate that its author has much practical as well as scientific acquaintance with the nature of that interesting and useful animal, which forms one of the richest gifts of Providence to civilized man. The communication is very acceptable to us, and we have no doubt will be highly valued not only by the agricultural and manufacturing portions of the com-munity, but by those who wish well to the prime pursuits of human industry, although they may not be directly or personally concerned or interested in raising sheep, nor establishing or prosecuting any manufactory in which "The Fleece" forms the staple commodity.]

Ed. N. E. Far.

ESSAY ON SHEEP.

By H. D. GROVE.

Of crossed breeds.

The general rule is that the lamb possesses an equal share of all the properties of each parent. The idea is very erroneous that the size and form are more affected by the one, and the intrinsic qualities of the animal by the other-for although, in the first generations, the resem-blance to the parent Ram may be most apparent, it is nevertheless certain that in subsequent years the distinctive qualities of the Ewe will again appear in the offspring. A pure race has been carefully preserved in Saxony, which has had great influence in improving the native wool by constant crossing with full blood rams. But it is certain that real and durable excellence can only be attained by preserving the pure blood; lambs may be expected, the fourth 12, the fifth and the best proof of this fact is found in Spain 18, and the 6th 22. Supposing that the oldest itself, where the Leonese flocks still continue to produce 25 per cent finer wool than those of Sozia; although the latter are supplied every year with more or less Leonese bucks, and the method of treatment is precisely similar in each.

The improvement produced by crossing naturally progresses most rapidly where the native ewes are of the best quality, although coarse wooled sheep may also be gradually improved upon in the same way; but in all such cases the size and form will be as much affected as the fineness of the wool, and all the attempts made to degenerating; and a further profit results from preserve the original size, while the wool was made finer have eventually failed.

In the selection therefore, of a breed, or of a single ram for the purpose of a cross, regard should be had solely to the fineness and colour of the wool-to the firmness of its adhesion to the skin, and to the general health of the animal-and not at all to the large size; which property will be sure to disappear in the sequel if the wool does not degenerate.

Of the introduction of a pure breed.

The raising of an unmixed breed of sheep su-

portion of our produce now finds its way to New perch, as I think, deprived of a portion of their perior to the original flock is certainly much more Vork and Philadelphia, in shallops of from 20 to fat by these cruel hangers-on. crossing with rams of higher grades bought sin-gly. It requires a considerable capital as well as very great care and attention.

It is seldom that young ewes are to be had at any tolerable price, and many persons who under-take this business are obliged to content themselves with such as cannot yield more than two, or at most three lambs.

A very important circumstance in a purchase of this kind is to inform one's self about the previous mode of feeding to which the sheep have been accustomed, and if any change is necessary, to introduce it gradually. Better feed will have a tendency to improve a flock, but it is dangerous to make even this change too suddenly .- Those who are able and willing to furnish capital for this purpose and devote the necessary attention to the business will nevertheless find themselves very soon repaid for their trouble and expense; since, in addition to the extra price of his wool, the owner of such a flock will very soon be able to dispose of full blood rams, and, as his flock increases, of ewes also; the price of which, if the best are constantly retained, cannot fail gradually to advance.

To make this business productive it is necessary to pay particular attention to the food of the ewes and lambs, and to have the latter dropped early in the season that they may attain their full strength at the proper period to produce their own young. Rams of inferior grades must of course be carefully excluded from the flock, and the ewes must be treated with extraordinary care to ensure long life and prevent premature barrenness. It is still doubtful whether there is an intrinsic difference in this respect between Merino and other sheep, or whether it is merely owing to the extraordinary attention they have received; but the fact is unquestionable that they usually rear healthy lambs at the age of twelve, and sometimes even at the age of fifteen years.

Even if the wool at that age should become a little less fine, the animal must not on this account be discarded, because if the blood remains unmixed this evil will cure itself. If these rules are carefully observed, the increase of a flock of fine blood may be made very considerable as will appear by the following estimate.

Commencing with 12 yearling ewes I estimate that each will bear one lamb the first subsequent season, and as many the second, and that half of these are ewe lambs. The third year 9 ewe lambs may be expected, the fourth 12, the fifth ewes have now become barren, the same progression will give, at the end of sixteen years from the purchase, a flock of 867 ewes of pure blood, and the low estimate of 6 lambs in all from each ewe is so much within bounds as fully to offset the chances of loss from disease or accident, if good care is taken in managing the flock.

The first purchase of ewes of pure blood will obviate the necessity of subsequent purchases of rams from time to time, which is absolutely necessary in a mixed flock to prevent the wool from the sale of the rams which may commence with the fourth or fifth year.

On the selection of sheep for breeding.

The most important point is to be certain of the pedigree of the animal to be bought, and a sheep known to be of pure blood should always be preferred before another of finer fleece and better form, whose ancestry is uncertain. Next in im-portance are the fineness and elasticity of the wool, the evenness of the fleece over the whole body, the absence of hairs-the strong, compact form-and full health. The best sheep are dis-

thick set form, with short legs.

The size of the body is of less consequence than the body at the same age. any of these particulars, having much less influence on the progeny than many people suppose. The thickness of the fleece is mainly affected by not continue through many successive generations without care in this point. There are many other marks of a supposed good ram, such as a large tuft of wool on the forehead, a large, hanging dewlap, much wool on the hinder legs, three rows of wool round the neck, &c. &c .- but

fineness of the wool, and therefore select in preference the largest, heaviest animals rather than those of the finest fleece; but in this case they fail of procuring the genuine merino blood which never reaches to a large stature under any cir-

cumstances.

e

er

ie

During pregnancy the ewes should be better fed than usual, and this feed should be continued till they are furnished with ample pasture. It is of great importance that the lambs should acquire strength enough very soon after birth to support the bad weather which may follow in the spring-and be able to benefit by the early pasturage, by which means they may be sooner weaned, and the fleece of the ewes increased by stopping the flow of milk.

The rams in every flock must of course be kept separate from the ewes and yearlings-the most convenient arrangement is to pasture them with the weathers. One buck is sufficient for about forty ewes. In Spain the proportion is 3 to 100 .-During the season of impregnation they are fed,

morning and evening, with oats.

In the season for dropping lambs the utmost care is necessary, and if the shepherd is not to be entirely depended on, the proprietor should have him constantly overlooked. The birth is com-monly easy but often slow. Ignorant shepherds are very apt on such occasions to be aiding in the birth, which is always useless, and often injurious.

It often happens that ewes will not own their lambs, particularly the first they bear; and in this case I would advise to sprinkling a little salt on the lamb, which induces the ewe to lick it, after which it will generally allow it to suck. If not, the ewe with her lamb should be placed in a sebe tied by the legs till the lamb has been once nourishment for the lambs, and should never be taken from them for other purposes, as is often practised by shepherds. About three or four bruised oats, or oil cakes softened in water, tender hay and well dried red clover, or other similar fodder. In order that the lambs alone may eat their proper fodder, an enclosure is made, through the aperture of which they can pass, while the full grown sheep are excluded.

This previous feeding enables them better to support being weaned at the proper time .-The weaning should take place very gradually

The jodder or hasture of sheep has been found after the most careful experiments to lambs, the next for rams and ewes, and the noorhave no effect on the fineness, and very little on est for the weathers. the quality and quantity of nourishment, and will the elasticity of the wool; but a very important one on the thickness and length and con-

course all important.

The most important circumstance in regard ble to other grasses. all these or any other similar marks I consider as of no sort of consequence, and believe they may all be found on very inferior sheep.

It sometimes happens that wool growers are more desirous of heavy fleeces than of superior more desirous of heavy fleeces than of superior plentiful to scanty feed and vice versa. It is possible to the strength of the sneep is that the supply dry and sweet. It is nourishing only in so far as except a little increase during the time of suck-ling. Even the wool often becomes weak and loose in consequence of sudden changes from plentiful to scanty feed and vice versa. It is perfectly clean straw affords almost no nou-lishment, except a little in the joints;—but it to the strength of the sheep is that the supply therefore essential that the fodder in winter and rishment, except a little in the joints;—but it the pasturage in summer should be provided in aids in digestion and helps at least to fill the sto-such manner as to subject the sneep to no changes of this kind.

00 FOR THE AMERICAN FARMER.

BOTANICAL SKETCH of the principal gramina useful, or likely to become useful, in husbandry.

No. V.

Panicum. LINN. | Panick grass. (Triandria-Digynia.) | Millet, Gc.

(From PANIS, bread, on account of the use occasionally made of the seed).

calyx is 3 valved-2 of the valves are opposite to be mutic. and equal. The third valve (exterior) is smaller. The corolla consists of 2 valves, cartilaginous, tember. unequal, and persistent. It contains three stamina and a round ovarium surmounted by two styles 2, Panicum miliaceum. with plumose stigmas. The seed is of an oval shape, but rather flat—it falls invested with the valves of the corolla. Oss. The third valve of flower.

The intricacy and difficulties attendant on this genus were adverted to in the last number. These arise not only from the many species included under it, but principally from the almost infinite variations in the features of those species. The flowers exhibit the numerous and diversified modifications of these flowers vary-some being polygamous-some awned-some awnless-and stems and the leaves present other differences. Under the genus panicum are included plants with ligneous stems. The seeds, too, considerably differ. In some species, they are flat, elongated, shining—in other species, round or cylindrical, and transversely wrinkled—in the fanicum hallens, they are triangular. Such being the anomales presented by this immense group, it is not to be wondered at that the accurate observations of modern Botanists should have led them 3. Panicum Laeve. to assume some of the subdivisions of Linnaus as the types of new genera, and to exclude some species, imperfectly determined at first. The inquisitive agriculturist will, at his leisure, investigate this subject in the works of the moderns. I must pass to the description of the most important species of hanicum, after observing, however, that the plants belonging to it delight in southern climates—and, especially, in tropical pegions. In the United States, few species only are found beyond the 40th degree of N. latitude. The genus increases progressively, as we proceed from north to south, until it strikingly pre-dominates. (See Nuttall, Elliot, Muhlenberg, Pursh, Michaux, &c.)

Guinea grass
Herb de Guinée.

The root of this valuable plant, which is perennial, puts out stalks rising to the height of four feet, and to a much greater height, under favourable circumstances. These stems or stalks are erect, glabrous, a little compressed in their lower The leaves are many, long, flat, green, divided by a white nerve, and smooth both on their upper and on their lower surface, but rather ciliated near the orifice of the sheath. The flowers form a terminal, loose, elongated, and ample panicle-the ramifications of which are filiform, and verticillated in the inferior part of the panicle-then in pairs-and, finally, alternate and sparse. The flowers have pedicels-they are oblong—very smooth—mutic—and of a greenish colour. Two very striking additional features distinguish this species. The 3rd valve of the calyx is appressed—short—and particularly re-

edly in a stream of water, in order that the dirt a flour, which is eaten in the same way as pap, caused it to be naturalized in Jamaica, and other

culture.
Obs. The Panicum Hirsutum of Swartz, bears

This PANICUM has by some Botanists been idenlower surface-and hairy at the orifice of the tified with the preceding; but it is larger in alsheath. The flowers form a terminal spike, the most every respect.—The leaves form a remarkaxis of which is villose and angular. When the able exception—they are narrower, &c. This valuable gramen was first observed by Jacquin in Guadaloupe, but it is a native of Abyssinia. As In the variety a, which has a larger spike, the well as the preceding, it is entitled to the particular attention of our agriculturists. The PANIand these flowers are sometimes of a violet or CUM COLORATUM, said to be a native of Spain and and remarkable by its flowers tinged with green and violet, hears a considerable affinity to the two preceding species, and likewise goes under the appellation of Guinea grass.

5. Panicum molle. SWARTZ. & Soft Panick-grass.

This is another valuable Panicum growing abundantly in the meadows of Jamaica. The root is perennial. The culm thick, pubescent, juicygeniculate and procumbent at its base. It puts shape, but rather flat—it falls invested with the valves of the corolla. Obs. The third valve of the calix is considered by some as an abortive flower.

This species of panicum is also annual, and a native of India. Its seed is farinaceous, but not the calix is considered by some as an abortive flower.

This species of panicum is also annual, and a native of India. Its seed is farinaceous, but not the calix is considered by some as an abortive flower. bread, in some countries-and, in other countries, olate-with pubescent sheaths. The joints are used in the same way as rice. The Tartars ob- thick and villose. The spikes paniculate, erect, tain from it a beverage, of which they are very fond; its most common use, however, is to feed poultry.

The stalk of the P. miliaceum is 4 feet high, which I have alluded.) The exterior valve is a coordinate and two flowered (one of those anomalies to which I have alluded.) very small-the interior oval, obtuse, pubescent. In the hermaphrodite flowers, the valves of the corolla are oval—nearly equal—the anthers of a deep purple colour. This is represented as opti-mum pabulum. The Panicum molle described by Elliott, as growing in the vallies of the seaislands, and particularly on Chaplin's island, does not quite accord with the above, and that eminent Botanist terms it "a plant salt and bitter." This may be referred, however, to local influences .-Michaux also found the PANICUM MOLLE in the sedgy meadows of Florida.

My limits now compel me to take a temporary leave of this interesting genus; but I shall revert to it in my next number, as it is far from being exhausted.

As images of peace and friendship are never foreign to agricultural subjects, I beg leave to mention, before I conclude, that the far famed calumet of the Indians is supplied by a variety of the Panicum latifolium, a native of North America. Some degree of poetic interest is, therefore, attached to this plant .- Humanity loves to connect it with the classic Olive branch.

Number of Mills generally-

Twelve Cotton Mills, employing 1654 mill hands-17,724 spindles-165 power looms.

Two Duck Mills, belonging to Messrs. John Colt and John Travers, and employing 235 hands -1433 spindles-106 hand looms.

Aggregate amount: 14 mills-1889 hands-Sir :- I take the liberty of enclosing to you a 19,157 spindles-165 power looms and 106 hand statement and census taken in this place; and looms; the latter devoted exclusively to the

Seven of the above mentioned mills have each a machine shop belonging to the establishment, one of which Messrs. Goodwin Rogers & Co.'s, employs no less than sixty-five hands. In point of extent and respectability in the execution of orders, this establishment is equal, we presume, if not superior, to any other in the United States.

About 420 hand looms exclusively devoted, when going, to the weaving of cotton, but at pre-Duck without sizing or dressing—he has made it sent there are only about 300 of them in operation.

One large Turning Mill and Chair Making Shop, employing 25 hands.

One Grist Mill and two Saw Mills.

An extensive Rolling Mill and Nail Factory, employing 25 hands.

Three regular Sabbath Schools, which furnish the means of gratuitous instruction to nearly four hundred children.

As our limits will not permit any lengthy comments on the foregoing facts we must content ourselves, at this time, with offering one or two.

General Remarks .- One of the most convincing ridences of the importance of a legislative encouragement to domestic manufactures, is here even. A population of nearly five thousand souls 51 has within a few years past, risen into social ex-

oumstances, only by the spindle and the loom .-Hundreds of destitute families have flocked into conducted with great caution. our village, under the judicious idea that, as far the greatest proportion of the mill hands are Hellebore, has been very successfully used. If dyspeptic affections-also in certain forms of the children, the services of theirs would be the cut into small pieces and scattered over the pla aource of a profitable revenue to themselves and their parents. Their hopes have been realized; found dead in the morning. This plant grows in for an instance here is rare, where the head of a swamps and mountain bogs, and is found all over the pla gout, chronic rheumatism, scrophula, palsy, and ill conditioned ulcers.

States!

-00 COCK-ROACHES.

TO THE EDITOR OF THE AMERICAN FARMER.

Dear Sir.

A correspondent of yours, in a letter dated Barboursville, 11th June, complains bitterly of the cock roach, which he says would be a fit addition to the plagues of Egypt. This denuncia-tion is not new. Brown in his celebrated Natural History of Jamaica, pronounces it the most loath some insect in America, and Hughes in his History of Barbadoes, compares it to the Harpies of Virgil.

" Diripiuntque dapes, centactuque omnia fædant portunity. Immundo.

seen in Jamaica.

A cock roach which keeps in ships, and is rarely seen on shore, and two other species which in fest houses. The largest kind is very flat and ed that unhappiness springs oftener house. Among the thermal waters, are those of New ereeps into almost any crevice. It lays its eggs and repetion of petty annoyances, and small vexaand repetion of petty annoyances, and small vexations, than from great and overwhelming calamiLebanon, New-York, temperature 72 degrees the state of the state silks. The other species is not so large or troublesome.

Hughes only mentions one kind in Barbadoes, which he describes as of a very dark snuff colour, lays many small brownish eggs.

In Turton's edition of Linnaus, forty-seven different species of blatta are enumerated, several of which are appropriated to our continent, and the West India Islands.

The blatta Orientalis, which is also of American origin, has long since been naturalized in Europe. Besides these, the blatta Occidentalis, Viridis, Pennsylvanica and several others, are said to be indigenous in the western world.

I have seen two kinds in this country-one of a bright brown colour, large and very offensive .-This I have observed in the City of New York, interesting to offer the following summary of the PUBLISHED IN THE AMERICAN FARMER, BY ORand it has been probably imported from the West analysis of the most useful. Indies. The other is black, small, less injurious, and perhaps a native. When Kalm travelled through this country in 1748, he denominated the cock roach which he saw, the blatta orientalis of the West Indies. But it has been seen in remote forests and unsettled regions, and is undoubtedly indigenous as well as exotic.

This insect multiplies rapidly, and as it is said to deposit its ova singly, its progeny is apt to be diffused. It selects the night for its depredations and being a winged insect, it is enabled to extend itself over a large space: and conveyed in merchandize and furniture, or by its own powers, it follows in the train of emigration and, like the rat, pursues man in his remote settlements

Several remedies have been prescribed for the extirpation or expulsion of this noxious animal.

2. The root of the vertarum viride or white family is industrious and economical, but they can the United States. Its vulgar names, are Hete rior to those of Ballston and Saratoga. These enjoy food, raiment and domestic felicity. weed, and Indian Poke. It is so deleterious that waters yield crows are destroyed by boiling Indian corn in a decoction of it, and scattering the grains so pre-So is it we should hope in all parts of the United pared over the fields frequented by them.

3. The most effectual remedy, however, is a vessel called a cock-roach trap, made of coarse earthen ware.

It is of a round form-diameter at the bottom 9 inches-and it tapers upwards until the diameter at the top is about 6 inches. It is about five the digestive organs, and calculous affections-inches high, and from the upper rim there is a particularly in the latter cases. gentle circular descent, say about one inch to the aperture or mouth, which is about four inches across. There is a plug hole near the bottom to let out the molasses with which it must be filled, in order to allure the insect; and hundreds are caught in this way every night. They find the descent easy, but to return is impossible.

In order however, that there may be no mistake, I shall send a trap to you by the first op. drogen. Muriate of soda prevails at Ballston,

With a view to remove this great annoyance I Brown says that three species of the blatta are have been induced to make this communication calculous and hypochondriacal affections-also in consequence, is really of great importance to the diseases or the remedies necessary to remove them, comfort of families; and it has been well observ- Bedford waters have been found excellent restofest houses. The largest kind is very flat and ed that unhappiness springs oftener from a series ratives.

WATKINS & HARWOOD, Inspectors. TREASURY OFFICE, ANNAPOLIS, July 7, 1824. True Copy from the original report on file in

B. HARWOOD, Tr. W. S. Md.

A SHORT RIDE IN CÆCIL COUNTY.

Sir. On board the Steam Boat United States, Capt Trippe, I amused myself after dinner with writing for your entertainment, if entertainment you exhibition of that propensity to experiment, in ment and a cultivated mind, he had improved his agriculture, which distinguishes modern from past times—as evidenced especially by his profit command of our naval forces on that station for tellis us that Ceres and Bacchus were mortals, able use of living fish to resuscitate dead land.

I embraced the opportunity of being on that shore, to pay my respects to Commodore Jones, of the Navy, and to make a long promised visit their attention in collecting, and bringing home to a venerable patriot of the revolution, who like from abroad, animals and vegetables of various hook, and enjoys otium cum dignitate, in the best taste, on the shores of the Sassafras.

I doubt if any part of the United States presents such smooth and beautiful roads to the traveller as are found on this peninsula. You may journey for a whole day without being incommod ed by a gate or impeded by a single spot of dandown a Jacob staff in some counties at a distance heat and drought. of more than 5 miles from sloop navigation.

probably through the eastern shore generally are; tail than the mule which springs from the ordina-the convenience of farmers to navigable water, ry union of the ass with the mare. I need not say the unbroken smoothness of the roads, the imany thing of his broad tail sheep, and black hogs mense extent and beautiful cultivation of their which I understand are with you. The pecufields of wheat and corn, which constitute the liarities of the hog are fineness in the grain of the chief, and in many instances the sole object of meat, and great aptitude of the animal to keep cultivation. I could not help smiling at the fat. Its size, for which it is not remarkable, is thought of the impression which would be made attained at an early age, and there is every reason those numerous fields of, from one to two hundred fashion of Maryland, and the southern states, acres of corn and wheat in a body!!

For the plough, horses are exclusively usedthese are of rather small light figure, of quick no wagons are used except by millers and manufacturers near Elkton.

In regard to the mulberry tree, of which mention is made in a late number of your Journal, by a scribler over the odd signature of Whip-poor-WILL, (a bird whose observations are never made or heard but when all nature is asleep), the author in hand states, that it was first brought from Persia, into Greece and Rome, and was more esteemed by the Romans, even in their most luxso much force that "their breaking forth may be evidently heard." But this vegetable circumspection, this cautious holding back, and then and all other Romances, the better in proportion to the time that has intervened, and the dis-tance of the "far off country" in which they

The transplantation of this tree to England was in 1548, where, at Sion House, the original trees are said to be yet flourishing. Many are now alive and bearing fruit that were planted in the time of James the first, and though silk is not now cultivated in England, the worms are said to thrive there as well as in any other part of the world—so doubtless they would in America, and we have an instance, I think in Rhode Island, of a gentleman displaying himself at a Cattle Show, in a full suit of silk of his own manufacture.

It is observed in Evelyn's Sylva, that this tree

Miller mentions eight varieties of this agreeable fruit. T. A. Knight, Esq. the President of the Horticultural Society of London, illustrious Immense improvements have been made in for his liberality of spirit, as for his science, is said to be the first person who has attempted, in the hot house, to force this excellent fruit, and that great patron and promoter of agriculture, T. W. Coke. Esq., M. P., has two mulberry trees trained to a trellis upon a south wall of his garden. These are about sixteen feet high, and the lateral branches extend nearly 100 feet. The fruit of these afford an abundant succession from July to October; and the fruit is much larger and earlier than that on standard trees-They are pruned twice a year, leaving spurs of two inches long, which, at the winter pruning are

ESSAY ON SHEEP. By H. D. GROVE.

[Concluded from page 132.]

On the Disorders of Sheep.

Almost all the disorders which attack sheep are caused by the want, and seldom or never by the excess of activity in the vital organs. The nerves are very susceptible, but seldom act with great force-and whenever they are powerful ly excited, this excitement soon passes off and leaves the animal extremely weak. It follows from this that most of the means required for the cure of diseases among sheep should be cal culated rather to excite than to allay the activi ty of the functions of life-a few of the most common diseases among sheep deserve to be par

The Rot

ticularly noticed.

e

Exhibits itself scarcely at all externally. The blood loses its high colour and tendency to coagulate and becomes watery. The first percep tible symptom therefore is the loss of the brigh red appearance about the eyes : the lips and in side of the mouth also become pale, as well at the skin generally under the wool. The ani-mal continues to feed well and does not grow poor, although the natural vivacity is diminishet and some signs of weakness occur.

who depended upon the manufacture of them as The disease commonly gains strength in the than sny other, until the proper mode of treataness of support; of the poverty to which the winter. Watery swellings are formed, particuloss of their usual employment must inevitably larly under the chin, which are often absorbed reduce them; and of the great value of their and then re-appear. Soon after these the animal merely touching the skin of a healthy animal with retreatance to the same with restrictions. labour to the nation.

Miss Sophia Woodhouse (now Mrs. Wells,) and Miss Sally Hanmer, of Wetherfield, Connecticut, had the merit of shewing at the exhibition of the Agricultural Society of Hartford in exhibits copious collections of water about the labour to the first hand of the labour to the first hand of the labour to t 1820, the first bonnet made in imitation of the chest and entrails, the blood is extremely pale sheep in many other ways so unfavourably. Legiorn hats, from native grass, called in that as well as the flesh. This disorder is unquest it is discovered by the animal's const state Ticklemouth.* We learn from the account tionably caused by feeding in swampy grounds, of the survey of Renssselar County, New York, that its botanical name is Agrostis Alba. It is a sheep. It is increased by damp, foggy weather, scabs are sometimes dry and sometimes moist, common grass of the northern and middle states, while on the other hand, dry warm weather but the excellent *hoa viridis*, or green grass and high pasture, especially where there are which is also a native of the United States, and many aromatic herbs, are sometimes sufficient more lively than before. Afterwards, however, forms the green sward of the middle states would to counteract the first symptoms and effect a the disorder becomes internal, the sheep bedoubtless answer equally well if prepared in a cure. This disorder, however, when it has reach- comes emaciated and dies from weakness and manner similar to that pursued with the Agrosed such a point that a common observer may pain. If the scab is observed at an early perintis Alba. If taken from the field where it sponnotice the symptoms, is probably incurable. At od it may be easily cured or at least prevented taneously grows, it would answer for common a very early stage a cure is possible if the flock from spreading. One of the best remedies is a hats; but for making those of a finer kind, the seed should be collected, and sown very thick early in the Spring. It can be purchased at seed in the seed should be collected, and sown very thick herbs ere abundant, and particularly among judiseased parts, after scratching off the scabs niper bushes, and in bad weather carefully with a comb or other instrument. The decocstores. The grass for bonnets should be collect-housed and well fed. Horse chesnuts are an tion of tobacco mixed with lime-water and oil excellent article for fodder in this case, also a mixture of juniper berries, wormwood, sage, will generally effect a radical cure; another exgentian, angelica root, willow bark and other cellent remedy is a decoction of hellebore mix-* Made at the expense of Stephen Van Rensgentian, angelica root, willow bark and other
sellær, President of the New York Board of Agbitter herbs with a little salt and grain which
riculture. See Memoirs of the Board, page 31, they will eat of their own accord, or if not, it morning before they are driven to pasture. If by weakening the general health. is the Agrostis Alba, but this latter species is the rot makes its appearance in a decided man-called "the American Leghorn Grass" in the ner before the winter sets in, it is useless to at-survey; and their identity is therefore taken for tempt any thing more than to fatten the animal grunted .- At all events the Agrostis Alba will as soon as may be, and sell him to the butcher. answer the purpose of making Leghorn imita- The rot certainly is not infectious, and it very often occurs that only a few sheep are attacked in large flocks; and generally in such cases, if † This first specimen of imitation Leghorn, the shepherd is honest, the disease may be tracfrom a native grass, was spoken of in terms of ed in every case to some swamp or other wet place where these particular sheep may have strayed.

The Mouth and Hoof Distemper.

These complaints seem to have a mutual connexion, since the former, which is the mildest, very often precedes the latter. In the mouth the principal evil to be feared, is that the sheep The best remedy is to bathe the part affected with a strong decoction of sage, mixed with an mixture. The disorder in the hoofs is soon dis covered by lameness, and if this is evidently not produced by any external injury, and especially if several sheep in a flock are attacked at the same time, great care should be taken to obviate the effects of this disorder. The best remedy is a poultice of dough or fat loamy clay which should be applied to the foot by means of a little bag, but not tied hard to the ancle, and kept constantly wet with vinegar, till a swelling appears on the upper side of the foot, or in the cleft of the hoof. This should then be opened with a sharp knife and the dead hoof pared off. The wound must be washed with cold water and sprinkled with dry vitriol. The lame animals should remain carefully separated from the sound ones, and the washing and sprinkling with vitriol, repeated till the cure is effected. This disease is not only contagious but also infactious in the highest degree and oftentimes so violent as to produce caries in the bone after the hoof is destroyed.

The Itch or Scab.

This disorder is dreaded more than any other, and did in fact more damage in many districts the body, then ceases to feed and soon dies.

It is discovered by the animal's constantly rubbing or scratching itself, and making at the should be administered in small quantities in the when the disorder has induced other complaints

The Sheep-Pox.

This disorder is contagious, and propagates itself by exhalation from the sick to the healthy animal, but it has not yet been discovered how far these exhalations may extend. If, however, it appears in a neighbouring flock, care should be taken to mitigate its effects by a general and careful inoculation, since it is certain that the disorder is less violent if taken by inoculation, than in the natural way. The operation is per-fectly simple and easy. The animal is laid on its back and held by two or three men while the operator introduces the matter, from a pustule five or six days old, in two or three places between the legs or on the tail. The lancet should be introduced in a slanting direction unbecome emaciated from the inability to eat. der the skin about the eighth of an inch, and when it is withdrawn, the skin should be pressed down upon it so as to wipe off the matter equal quantity of vinegar and a little honey. and leave it in the wound. A pustule is formed If the blisters continue to spread, half an ounce generally in four days, and reaches its greatest generally in four days, and reaches its greatest of blue vitriol should be added to a quart of this size on the sixth, when a few others generally appear near the first,

Soon after this the usual symptoms of fever and general eruption take place, which last is however, more regular and safe than if the animal had taken the disease without inoculation.

The only care necessary during the progress of the disorder, is to keep the sheep in a cool and airy situation. Internal remedies are not required, but the sores should be often washed with a strong infusion of camomile flowers in which a little blue vitriol has been previously dissolved, and afterwards dressed with a salve made of yolks of eggs and turpentine, mixed with a little powdered charcoal.

The Reeling Sickness

Is never infectious, but generally incurable. Its first symptoms are a weakness in the gait, and a disposition in the animal affected to remain separate from the flock. The head is thrown into an unnatural posture, generally on one side. The animal then begins to turn round, always in one direction,-stumbles and falls repeatedly, sometimes with the head under to this disorder, and very rarely sheep over two years old. The seat of the disorder is always to be discovered on the brain where one or more blisters are formed and filled with a watery secretion.

The origin of this complaint, and of course the proper preventive treatment, remain as yet undiscovered. A cure is sometimes effected by an operation through the skull to let of the wa-

bone which usually indicates the spot affected. country. verse. If it succeeds, however, in only one very great. cure out of five, it seems worth the trial; since perish.

C.

should be the seeding, and that rich lands only farmer who has any use at all of tools. may sustain and raise to perfection, the multi-plied starvling progeny of deep buried grain which I have no hesitation to assert.

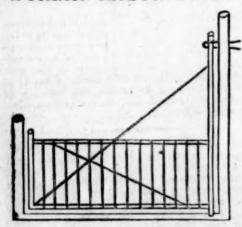

It may be objected that as deep seeding multiplies the branches, so it may be used, even in poor lands, for economy in seed; but it will be held in view, that though by deep seeding, thinby, you may grow as many stems, as by shallow-seeding heavily, yet upon the principles laid down, the stems will be of secondary and sickly growth, and in a soil of moderate powers, will disappoint a most moderate and meagre hope.

From the same principles is necessarily deduced the fallacy of grazing wheat, with sheep and other stock; a practice lately obtaining a very general currency, with a view to destroy the fly; whereby, an uncertain evil is anticipa ted and perhaps not averted by a practice, which must upon known and established principles, generally ensure a diminution of the crop.

I have been induced, Messrs. Editors, to make the above remarks not with a view to appear before the public, in the garb of an outre costume, or affected singularity, but because I hold it to be my duty as an agricultural member of the community, to eradicate what I conceive to be a prevalent and pernicious practice, and to substitute therefor, a theory and practice, which in my thorough conviction, is both true and useful.

I have the honour to be. Your's respectfully,
JOS. E. MUSE. Cambridge, April 2, 1824.

A COMMON GATE FOR A FARM.

TO THE EDITOR OF THE AMERICAN FARMER.

DEAR SIR,-

I send you above, a plan of a very simple, though, in my humble opinion, a very good Gate for a common Farmer .- It scarcely needs an explanation, as it is of so simple a construction that a bare inspection of the figure will be sufficient at once to understand it.

The main improvement in this gate over many others of similar construction, is a piece of timber or lathe, reaching from the foot of the front piece of the gate, to near the top of the hind piece; and this hind piece is made to reach much higher than is common, so as about to equal in length, the top or bottom piece of the gate; and thus the grand and universal failure of all large gates, (to swag) is remedied; for you will observe by the plan, that the fore end cannot possibly swag or sink without pulling the top of the hind piece along with it, and it is a very easy matter so to confine this as not to move an inch : you will also discern from the figure that these tinue so for many years, gradually deteriorating, ficies,

The pieces which compose the frame of the gate, should be about three inches, by two and a half—and the cross pieces and supporter (as it might be called) about two and a half inches wide, by one and a half or two inches thickthe pieces composing the frame of the gate are morticed together, the supporter and piece runhole, made in this sill—the bottom end of one ply a hickory or white oak band, which goes This gate may be latched in any way that may suit the contrivance of the maker. This plan of in my neighbourhood, being first adopted by one farmer-he was soon followed by all his neighbours; but so slow are we in discovering and adopting new improvements, however useful and simple their construction, that I believe in many parts of my own county, this plan of a gate is not known. If you think it is worthy of insertion in your valuable paper, you are welcome to

Your obedient servant, JOHN F. CARUTHERS. Rockbridge County, Virginia.

The true principles of gate-hanging have been explained in this Journal vol. 1, page 182. The plan above described, secures no doubt the advan tages there stated-but as the upper and lower pivots of the gate have a perpendicular relation to each other, how is the falling to of the gate regulated ? - Edit. Am. Far.

HOW TO GET

NEW VARIETIES OF POTATOES.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir,-I feel much pleasure in answering the inquiries Mr. Pursley, in your No. 16, having re peatedly renewed my stock of potatoes by new varieties, obtained in the following manner.

When the vines are done growing and are turning brown, the seed is ripe-then take the balls and string them with a large needle and strong thread, hang them up in a dry place, where they will gradually dry and mature, without danger of injury from frost. In the month of April soak the balls for several hours in water, then squeeze them to separate the seed from the pulp; when washed and dried they are fit for sowing in rows, in a bed well prepared in the garden-they will sprout in a fortnight—they must be attended to like other vegetables-when about two inches high they may be thinned and transplanted into rows, about three or four inches apart; as they increase in size they should be hilled. In the Autumn many of them will be of the size of a walnut, and from that to a pea. In the followthe large ones together—they will in the second season attain to their full size, and will exhibit several varieties of form, and may be then selections of Newcastle, and twelven breadth, 225 miles ed to suit the judgment of the cultivator. I of iron rail-way were confructed above ground, would prefer gathering the balls from potatoes of a good kind. The first crops from seed thus obtained will be very productive, and will con within a space of less an ainety miles of super-

ed, that the weaker the soil, the more shallow gates can be easily constructed by any common until they will again need a renewal by the same process.

> Respectfully yours, Aew Jersey, July 15, 1824.

PRESERVATION OF POTATO APPLES. Wye Mill, July 12th, 1824.

Sir,-My countryman at St. Michaels, seems gnorant of the means of preserving the potato ning in the opposite direction, are let into the ignorant of the means of preserving the potato frame and then nailed; the cross pieces are apple, from frost and rot.—Should you to whom he looks for information, not be acquainted with simply nailed on. The gate posts are two Lo- he looks for information, not be acquainted with cust posts united at bottom by a sill, which is any thing more efficacious than the following, partly buried in the ground, in a small bowl-like please through the medium of your agricultural paper to make it known to him .- Prescription side of the gate turns, as on a hinge, whilst the as follows: let him make a strong pickle or upper end of the same piece is confined by simtherein, and suffer them to remain for 24 hours, through the gate post and is there made fast, then remove them and put them into a sufficient quantity of strong vinegar sufficiently spiced with red pepper, and keep them suspended in the a gate is taken from some gates which are in use chimney during the freezing months; the foregoin my neighbourhood, being first adopted by one ing is an infallible method. Another method not so complex : let the apple when ripe, be split and exposed to the sun, or in the shade in dry weather, till it becomes sufficiently dry, then inclose it in a linen or other bag suspended in a warm place, till wanted for sowing.

I am, sir, respectfully,

SENEX.

- To MR. J. S. SKINNER.

-0-CANALS.

The following particulars, respecting canals in England and France, will be found of some interest, particularly the fact that our own state will soon contain as many miles of completed internal navigation as the latter extensive and highly populous Kingdom. The extract is from the last number of the Port Folio.—[N. York haper.]

It appears from M. Huerne's work that the

number of canals in the United Kingdoms is one hundred and three, of which ninety-seven are formed in England alone, not including those of which the length does not exceed five miles; we in Scotland, and only one in Ireland. The total extent of these canals for the three kingdons is 25821 miles: i. e. 2471 miles of English catals, 1493 miles in Scotland, and 611 miles in the Dublin and Shannon canal. The sum expeded in these constructions is estimated at mor than £30,000,000 sterling; and in some cases, ne original shares have risen in a few years tofifteen, and even twenty times their original value. In the lines of these canals, forty-eight subtrraneous passages occur, the entire length of shich is not known; but forty of them whose legths are stated, give a total developement of 57,51 yards, or more than thirty two miles. It is deerving of remark, that, of the total length of se English canal, (2471 miles) more than 1400 niles communicate with the grand navigableine between London and Liverpool; the length of this alone being 264 miles; and it is connect in its course with forty-five others, of which he united extent equals 1150 miles.

In speaking of the iron rail-ays, the author states, on the authority of a port, dated 17th August, 1817, of the proceedigs of a society for

Such is the present state of the English navigable canals: not a yard of which existed before the year 1755. Till that time, the idea of canals was whiter, more, and better flour. It does not reridiculed as superfluous and absurd, in a country like England; enjoying as it was said, favourable greater growth; although like all other cerealia lines of coast, and provided with numerous naviit flourishes in proportion to the richness of the lines of coast, and provided with numerous navi-gable rivers. It is well known that the Duke of Bridgewater, by opposing himself to the prevail-It ing opinions and prejudices of his country, first demonstrated the practicability and importance of in Cayuga, it has never been known to suffer such works; and to effect his purpose, on coming of age, he limited himself to a personal expendi ture of £400 per annum; applying the remain-der of his revenue to the construction of the first canal, bearing his name, and which forms an imperishable monument of his genius and patriot ism. This work, completed in 1759, proved the practicability and advantage of the system, and laid the foundation of all that has since been effected in it, so highly to the interest, the convenionce, and the reputation of the country.

Of navigable canals in France, the number is very inconsiderable, there being only six of the first order, and about twenty of inferior dimensions. These six are, the canal of Briare, com-pleted in 1642; that of Languedoc, in 1680: that of Orleans, that of Lorgan, finished in 1723; the Canal du Centre, in 1791; and that of St. Quentin, 1816: the total length of which amounts only to 591,000 metres, or 378 English miles. The se condary canals have a total length of 250 miles, making thus together only 628 miles of navigable canals, in a territory containing 26,700 square French leagues; being quadruple the surface of England, and with a population nearly three times the report of a committee to which had been re-

as great.

A report of the tobacco inspected at and delivered from Nottingham Inspection Warehouse, during the quarter, commencing on the first Monday in April, eighteen hundred and twenty-four, nd ending on the first Monday in July, in the year of eighteen hundred and twenty-four.

B. HARWOOD, Tr W.S. Md.

Editorial Correspondence.

Albany, 10th July, 1824.

I send you a specimen of the celebrated White Flint Wheat, which flourishes in some of the western counties of this State. A considerable quantity of it has been brought to this city for that a bushel is reserved for you.

This wheat has been mentioned in your paper, and has been favourably noticed by the Agricul-Society of the Valley of Virginia. It was known in Cayuga county in 1815, and was brought there from New Jersey. Mr. Watnus' wheat was not sent there until 1818—both may have proceeded from Spain, and may probably have a common

The qualities of this wheat, as represented to me, are pre-eminently good, and I have no doubt the introduction of this plant might be advantageof the correctness of the following statement.

A less quantity of seed is necessary for sowing, quire so much soil as other wheat, and takes a

It produces five bushels an acre more than any other wheat, cateris paribus. Since its adoption mildew, and it is not so much exposed to winter hulling as other wheat in general.

But its most distinguished good quality is its being invulnerable to the Hessian Fly. This is ascribed to the stalk, which is much smaller in the channel, and as thick again as the stalks of wheat in general.

Our most experienced millers and merchants speak of this wheat as superior to any other.

I send you a small specimen of Salt made at Salina, in this state.

July, 1824.
The average crop of straw is quite, or nearly well. The quality of the grain is also inferior to moisture long. One covering will answer two the samples of last season. the samples of last season.

At a meeting of the Board on Thursday last, ferred certain resolutions, deemed extremely important to the interest of agriculture, particularly this section of our county, was received and adopted unanimously, and ordered to be prepared for publication.

We are determined to make one more effort to rouse the strong and useful, but sleeping, energies

of our brother farmers. Extract of a letter dated Taburg, (N. Y.) 4th

July. "We have had an unusually cool Spring and by bursting .- Edit. Am. Far. Summer thus far; our corn (one of the great staples of this county, and in the next, Madison, the "Plus Ultra" over all who have raised this article) is backward. English grain and grass shows well; and the moist weather we have had, will, on the whole, be an advantage to this section of the country, by recruiting our grass lands, nearly run out by the remarkable dry seasons the four years past; in fact, since the Great Eclipse, and spots on the sun, this region of country has been blessed with fine seasons and much abundance, with a market at our doors, owing to the encrease of population in this wooded country, by the constant ingress of settlers, on small farms of 50 to 100 acres.

By the by, let me ask you what your correspondent has done with his Eclipse of the 27th ult. He has disappointed me in accounting for our cool weather; vol. 5, p. 53.—This, with the invisible spots on the sun, would have settled all matsale, by Mr. Elias Manchester, a respectable ters.—I do not see that you have got a model of farmer of Scipio, Cayuga county—and I shall see a true Yankey scraper for the road—and then our system of taxation in this State, is the secret of our roads being as good as they are, and so

6th July, 1824.

MR. EDITOR, In looking over Buchanan's Travels through a part of India, I observed that he speaks of the Ragy (or Cynosums Corocatus) of the Botanists, as being next in importance to the rice crop-as

BOTTLING CIDER.

To the Editor of the New England Farmer. SIR,-As the time approaches when those who bottle cider must be taking some precaution to preserve their bottles from bursting, I take the liberty to suggest to your country readers a method, new, cheap and effectual, for preserving both cider and bottles through the heat of summer. In swamps, springy and cold, great quantities of moss are found, which may be ea-sily gathered. With this cover your bottles, set on the ground in the northerly part of the cellar, and with a water-pot drench the moss Extract of a letter dated Talbot County, 17th with cold water once a week, or once perhaps in a fortnight will be sufficient. This I have found from several years' experience, a perfect equal to, our usual average, but there is a very security for the bottles, and much less trouble general complaint of scab—and in some situa- than any other method I have tried or heard of. tions also, both rust and mildew.—The wheat is observed to shatter much less than usual, from the handlings and operations of inning; and cleaner. Moss is easily obtained in the countere is no more certain test that it will not yield try, from low, cold lands, and when wet retains

> Your's respectfully, WILKES ALLEN. Chelmsford, June 1, 1824.

* In this concern, the Editor of the American Farmer has been unfortunate.—He has lost in for-mer years a great proportion of his cider, though buried in sand in the northern part of a cool cellar, and kept moist—and this year he had pre-sented to him by Doctor M'Culloh, a barrel of the best cider he ever tasted, and buried it in salt .- Out of eleven dozen, about eight were lost

To the Editor of the New England Farmer. SIR,—In August last, I inoculated some Pear trees with buds of a large winter pear, obtained from the Williams farm in Chelsea; and now I observe fruit of good size, on several of the shoots, which are wholly the growth of this season. I should like to be informed how such slips of dame Nature are accounted for. A BROOKLINE FARMER.

TO AGRICULTURISTS.

A SILVER PITCHER, to cost one hundred dollars, bearing suitable devices and the name of the person who shall obtain the premium, will be given by the Merchants of Blakely, for the best wagon load of Cotton, of not less than six bales, each weighing three hundred and twenty-five lbs. or upwards, which shall be delivered here on or before the 20th December next. On that day the premium will be awarded for the best Cotton in the best order The premium cotton to be ship-ped as such, either to Liverpool, or to a northern manufacturer—at the option of the planter.

The committee of award, to consist of the five

following persons:

William Chase, Thomas Strang, Samuel St. John, Jr. Russell Stebbins, and John Stocking, Jr. Blakely Reporter.

We are informed by a gentleman, that on the ous to the interests of southern agriculture, you farm of Jesse Bennet, Esq. residing in Baltimore the one we have just mentioned.—Balt, Chron.

From the Boston Centinel.

TO THE BUTTER MAKERS IN NEW ENGLAND. The writer of this note could tell a long story about butter, having been 45 years in the trade, united efforts of twenty thousand. He was near-

all the butter-milk; put no more salt to it than He called to him a chief de bataillon, named Chewill make it palatable, for salt has no good effect vardin, for whom he had a particular regard .as to keeping butter sweet; it is working out all "Take (said he to him) a company of grena-

which will contain 20 or 25 lbs.; soak the kegs well in a strong pickle, and then tar them; pack cuted the order, and his death, in fact, arrested the butter solid—not in layers as is too often the the enemy, and saved the French. There is case. This method of packing butter gives you something grand in the judgment of Kleber on a double chance for sale; for being equally handy the character of Chevardin; and on the side of spectfully acquaints the public that he has our for home use, for butter cannot be exported ex- duced by a simple word of confidence. cept in kegs.

der; but the other method is ruinous.

HAYTI.

This island is delightfully situated, abounding life. It presents to the eye the most romantic and beautiful scenery, and while its verdant mountains recal to our minds what we have read of ancient Gilboa, Tabor, Lebanon, Carmel, and Sion, its fertile vallies present us with the rich luxuriance of the vallies of the Israelitish Ca-

The staple productions are coffee, rice, tobacco, indigo, and Indian corn. The forests abound with the best of mahogany, logwood, and fustic; and the pastures are literally covered with flocks and herds.

A yoke of well made oxen, measuring six feet six inches, may be purchased for 17 or \$18; a handsome cow and calf, for \$7; and swine and poultry at the same rate. I'he markets are supplied with a plenty of fresh and salt water fish oysters, lobsters, and turtles. A turtle weighing 80 or 90 lbs. may be purchased for \$2. Through the months of June, July, August, and September, I resided upon the Island, and during this time which is considered the hottest part of the year, and the most unhealthy to strangers, I enjoyed as good health as at any period of my life.

The Haytiens have made great progress in the mechanical arts, which receive liberal encouragement. Gold-smiths, silver-smiths, black-smiths, tailors, boot-makers, painters, cabinet-makers, coopers, tanners, curriers, house-carpenters, shipourpenters, turners, wheel-wrights, tin-workers, sugar-manufacturers, and distillers, would find constant and profitable employment.

MILITARY ANECDOTES.

TO THE EDITOR OF THE AMERICAN FARMER.

Taburg, July 18, 1824.

DEAR SIR,

I perceive an "important discovery" by the Middleborough (I believe) boy, of milking cows by straws or tubes, is going the rounds, and as I have tried the experiment on my cows to their injury, I think it my duty through your useful paper to say, that although I succeeded in drawing off their milk, with perfect ease, and without any apparent pain, yet I found on the day following, that inflammation had taken place in their udders, the milk was clotted, unfit to use, and the quantity diminished one half; and although it is now ten days since I tried the experiment, they have not yet got over it, or come to their

The weather has continued cool, and it is much feured our corn crop will fail. English grain and grass abundant.

With respect, your obt. servt. JOSEPH BLOOMFIELD.

TO THE EDITOR OF THE AMERICAN FARMER.

Brooke Grove, 7th mo. 24th, 1824.

DEAR FRIEND,

I have seen in the last Farmer which has come to hand, the root of Hellebore recommended to destroy roaches. I believe it effectual, but think it necessary that those who use it should be cautioned to be careful that children, poultry, &c. be prevented from access to it, as it would be equally destructive to them. I have known one instance of 15 chickens being killed by picking up a few shreds of the root that remained after the roaches had fed on it.

In haste and with respect, thy friend, ROGER BROOKE.

CELEBRATION AT FLUSHING, OF THE

BIRTH-DAY OF LINNÆUS,

By the New York branch of the Linnwan Society of Paris; 24th May, 1824, as reported for the New York Statesman.

Pursuant to previous arrangements, the second celebration of the birth day of Linnaus, by the of natural science in our country, in its best form, New York Branch of the Linnaan Society of chastened by a regard to the precepts and exam-Paris, took place this day at the village of Flush- ple of the illustrious sage, whose birth-day was ing. At 8 o'clock in the morning, the President to be commemorated by festive rites. Dr. Pascaand members of the Society, accompanied by a lis, President of the New York Branch, then gave numerous and respectable party of ladies and a succinct account of the transactions of the pagentlemen, comprising much of the beauty, taste, and fashion of the city, embarked on board the new and elegant boat Linnaus. Among the dis

At the conclusion of the exercises in the hall, and fashion of the city, embarked on board the new and elegant boat Linnaus. Among the dis tinguished strangers, who joined the party, were Swedish Consul, and Le Ray de Chaumont .-The Rev Mr. Penneveyre, Rev. Dr. Wainwright, Rev. C. Jones, Rev. Mr. Brientnall, and several other clergymen of this city, were also present.

The boat left the wharf, with her banners in-scribed with the name of Linnzus, waving in the wind, and to the tune of Clinton's Grand Canal March, by a full and excellent band of music, woods, and waters, wore the brilliancy and mild smiling countenances and light hearts of the fes-

ply of milk be imputed to her being carefully all acknowledged its superiority; and the Pope other transactions it was, on motion of Mr. Clinkept from green food, in the use of which there when he tasted it, loudly proclaimed its pre-emi-ton, unanimously resolved, that Mr. Elliott, a ton, unanimously resolved, that Mr. Elliott, a distinguished naturalist of South Carolina, Professor Silliman, of Yale College, and Dr. Hosack, cording to the present method. It has been of this city, be recommended as honorary mem-observed, that the grapes which contain most of bers of the Parent Society at Paris; and that Dr.

> The Secretary also read a note from Mr. Jefferson, dated the 17th instant, addressed to Doctors Mitchill and Pascalis, in his own hand writing, in which, after reciprocating their kind reing this essence with the common wine of the Canton, the real Tokay wine is produced. Of this wine there are two kinds; the Ausbruch, his happiest manner, and with great force and and the Masklass. The former contains twice beauty:—"It would certainly be a great enjoyarment to be present and to participate with his worthy disciples of the society of New York, at but a naturalist has discovered that what they their celebration of his birth: as that prospect, mistake for gold is the egg of a small insect, however, recedes from my view, another advances round which the sugar chrystalizes, and acquires with steady and not distant steps, that of meeting a gold colour. This does not, however, disprove the great naturalist himself, and of assuring him the existence of gold in invisible particles in certain in person of the veneration and affection with vegetables, a fact which is evident from the ex- which his memory is cultivated here: in the mean time I must be contented with testifying to you my cordial concurrence in these sentiments, and to add those of my great respect and consideration for the society and for yourselves."

An extract of a letter was likewise read from Judge Davis of Boston, an honorary member, in which he regretted his inability to participate in the pleasures of the day, and in those exercises which have a tendency to promote the cultivation

the company formed in procession, and moved Mr. Worthington, late Governor of Ohio, the to the Linnaan Garden, at the entrance of which they were politely received and welcomed by the proprietors, the Messrs. Princes, who conducted them through walks, bordered with trees, shrubs, and flowers of every variety, and beneath triumphal arches hung with wreaths, to an arbour in the highest part of these extensive grounds. A temporary rostrum, sufficiently spacious to accommodate the members of the socie-As but little is known respecting the vineyards who enlivened the passage up the sound with a ty, was erected expressly for the occasion. garlands of glory. Researches into the mineral kingdom, will produce treasures of renown more valuable than the gold of Ophir or the diamonds of Golconda. The genius of philosophy has not yet penetrated the depths of geology—nor proceeded far beyond the alphabet or the horn-book Theory has followed theory, and speculation has supplanted speculation. The imagination has been consulted more than the judgment and the airy castles of hypothesis have dazzled the fancy without enlightening the understanding. After a vast accumulation of facts, and perhaps a long afflux of time, some Bacqn or Linnaus will rise up and change it from romance into science. Chemistry sprang from the crucible of the alchemist, like Pallas, from the head of Jove; and even the er roneous movements of scientific investigation, will finally contribute, by a heaven-directed im-pulse, to the cause of useful knowledge.

With these animating prospects, with these exalted inducements, let us proceed to the duties of the day, ever bearing in mind, that science is honour, and that knowledge is power-and that all their ways are ways of pleasantness, and all their paths are peace.

Abstract of the transactions of the Linnæan So-ciety of Paris, with remarks by Dr Pascalis.

LADIES AND GENTLEMEN :- On a former anniversary of the birth-day of the illustrious Linnaus, the celebration of which was graced by a respectable assemblage of our fellow-citizens, I ascertained in the mosses, their roots, stems, for investigation, because the ulva palustris was dety of Paris, the urgent motives that impelled the liage and organs of fructification, of which he signated as a swamp or marsh plant, while it is learned of Europe to unite themselves, for the purpose of encouraging and promoting the study of the natural sciences. To this intent they have in all mosses, and presents only five variations which cannot thrive in low humid meadows, but upheld and recommended to the world the system or characteristic differences; consequently, five prefers hills and dry plains. It therefore seemof Linnaus, as a most satisfactory and trustwor- classes, which are subdivided into forty five ge- ed almost futile to seek a proper fodder among thy guide, easily susceptible of amendment where nera, receive all known mosses. His splendid aquatic vegetation; but M. filaments endued with spontaneous and rapid motions in every direction from the right to the spiral line; when macerated for eight days in water, it resolves itself into a mass of globular in the Bosphorus more than forty species and animalcules; and when submitted to chemical analysis, it gives water, mucus, a gummy substance, a portion of greasy matter, and a small proportion of carbonate and phosphate of lime, and muriate and sulphate of potass. The Tremalla Nostor, is accounted the link between the animal and vegetable kingdoms.

I hasten to mention another important essay elating to a new article of fodder for sheep.

Our colleague, the indefatigable Thiebaut de Berneaud, some time since, discovered, through his familiar acquaintance with ancient classical authors, that many of them often adverted to a certain plant as peculiarly the best for the nourishment of that precious animal, so useful to man. The Hebrews called it, achu, the Greeks, tipha, and the Latins, ulva palastris. Among those three nations, large flocks of sheep were considered an invaluable treasure; and they devoted to them great care, changing their pasturage with the seasons. They managed them attentively not only for the flesh, but for their fleece, which, Europe, perfected in this country their acquire- with the addition of gold and the Tyrian dye, ments in their favourite science. As it is a satis- composed even the priestly vestments and the faction to trace where the footsteps have trod of regal mantle. Dr. Mitchill's Communication to the New York Branch of the Linnæan Society.

MR. PRESIDENT-The arrival a few days ago of a collection of Helvetic and Italian plants from Berne in Switzerland, through my correspondent the famous Brunner, and my fellow citizen, the enterprising Wagner, enables me to present you some of the vegetable productions of those coun tries. The whole herbarium amounting to several hundreds of species, is here on the table; but instead of opening and displaying them all to your view, a task of days and a study for months, I shall enumerate a moderate number that are remarkable for their localities, and show a few that are memorable for their association, or some other circumstance.

Berne, you recollect, is the name of a city and a Canton, situated among or near the highest mountains in Europe; and associated with that distinguished region, the Canton de Vaud. Within its precincts, the Institute of Pestalozzi at Buckse'e, attempted an improved organization of primary schools; and the establishment of Fellenberg at Hofwyl, taught the method of deriving from the soil, the greatest amount of produce with the smallest expense, time and labour.

From the terrace of the Cathedral, the stupendous Alps arrest the eye On a clear evening, they appear with their utmost magnificence and splendour. The milder scenery consists of romantic mountains, craggy rocks, gloomy forests, verdant meads, and the chequered works of agriculture.

I shall suppose we are making excursions hence to several places; and along the banks of torrents, I pick up the changeable saxifrage; from the road side, a purplish grass; and from an enclosure, the famous Bear-grape; and gather from their respective stations around, the picturesque anemone; the mountain-cress; and the deep blue linaria; while the Bartsia, the Arabis, and the Ophrys invite cropping, that they may be embalmed for this exhibition.

The ravines and glens of the Vallais, as visited, enough, the spartium, the ononis, the Delphinium, to have shot from the top of his son's head the ap and the Veronica associate themselves into a bouquet for a similar purpose.

Mount Sempronius sends from his frigid summit, the hardy Luzula, and from his shaggy sides, the yellow revedu, the swarthy cytisus, the hairy fern, and a number of his verdant occupants.

The Col de Balme begs you to look at his Rumex; and the heighths of Savoy intreat your favourable notice of their Statice.

Who has not heard of the elevated and towring ridge of the Great Saint Bernard? But who, until now, ever knew that he furnished liberal and elegant supplies to a "fete champetre et botani-Two species of Carex, two of Juneus, and one of Trichodium, show that he supports grass es, plants of the utmost importance to man and beast; and a Senecio, a Sisymbrium and a Pedicularis, prove that he sustains other plants remarkable for their foliage and flowers.

of the trophies contained in their arsenal, as well as of the imposing number, fine condition, and ple placed there by Governor Grisler, and by that means saved his life; and by the same act laid the foundation of the Helvetic revolution.

"Haller was born in this city, during the year 1709. The accounts of his display of genius, and aptitude to acquire knowledge, are as remarka-ble as perhaps any upon record. Before five years of age, he was accustomed to write down all the new words he had heard during the day. Soon after, he formed for his own use, rules in gram mar, arithmetic, and other sciences, and at nine had composed for the same purpose a Greek and Hebrew Lexicon, a Chaldean Grammar, and a Historical Dictionary, from Bayle and Moreri, containing more than two thousand lives. At ten he wrote a satire in Latin verse against his tutor, a man of provoking harshness and severity; and he early commenced the practice, which he continued through life, of always reading with a pen

What is your will say I, cryp-my and Surgery in the University of Gottingen, togamic and phanerogamous creatures, that you in his Electorate of Hanover. There his career was marked by industry, ability, usefulness, and and fashionable company? They utter, (or I am renown. After seventeen years service, in that so rapt, that as far as I can comprehend their capacity, he returned to Berne, where he became a magistrate, a member of the Council of two say something, director of the destinies, that hundred, a superintendent of the salt-works; and becomes the magnitude of Haller's character, or was employed in various situations, academic, you shall be frowned upon by posterity; inasmuch forensic, political and economical. His health as you neglect this illustrious man, your succes and resources held out until the year 1777, when sors shall cover you with oblivion." Mercy on he died at the age of 68, leaving the fame of one and resources held out until the year 1777, when me! answer I, as I wish to be remembered, let of the best informed men in Europe. His acme remember others;" and thus I vent, like an quaintance with books was wonderful; his memory prodigious. The writings and compilations he "In speaking of Berne, I should be inexcussible has left, are rich and honourable monuments of if I omitted the name of Albert Haller, one of its most distinguished citizens, and one of the most illustrious men of his age. The Bernese are proud ing him incidentally, and not writing his life.— Yet, if I should make an additional remark, it would be that Haller is more worthy of the imihave sent their Artemesia, their Celtis, and their orderly distribution of the arms and wallke tation of young men, who aspire to literary, pro-Centaury, to grace the present festival, and as stores. They show with exultation the statue of these were not rare, numerous or beautiful William Tell, who with an arrow, is reported examples the world affords."

Charming is the prospect of Italy when viewed from the Alps; more interesting is the exhibition it makes from the nearer and humbler Appenines. Piedmont, fertile in plants, offers you as specimens of her ample and diversified herbarium, the saxifrage, and the Sysimbryum. They invite your attention to the south.

Let me beg your indulgence, while I pluck a few flowers, as I travel along. See here the elegant gnaphalium stachas, from the mountains; the pretty dianthus atrorubens, or purple pink, which grew by its side; and the neat achillea agerata, or single-stemmed milfoil, plucked from the same neighbourhood. Observe, I entreat you, how beautiful they all appear in death!

Tuscany is under an alluring cultivation. You shall be gratified by a sight of a few of its productions as we go. The Thrasymene lake offers you a tall acquatic grass; and the Alban lake, a specious flower detuce. The garden of the Grand in his hand, making extracts of every thing me. specious flower detuce. The garden of the Grand morable in the work, and adding his own opinion Duke furnishes the wild chervil, or charophyllum you see the Nardus and the Gnaphalium gather of it. This was the foundation of his immense aromaticum; from an adjoining field came the variegated thietle, I show you; and from the ready known by their useful labours, researches licacy, and to pluck a twig from its stock. ready known by their useful labours, researches licacy, and to pluck a twig from its stock.

Let us next suppose ourselves at Naples, and Be not impatient, good friends, if I devote a ries filled with the rarities and elegancies of art, that we have surveyed the volcano of Vesuvius, breath or two more to classic ground. On land-

The following is Mr. Parry's communication: -

> Mitchell Street, Bartholomew Square, March 18th, 1822.

SIR :- Agreeably with the conditions of the Society of Arts as contained in your letter of the 22nd ult. I have sent a sample of the Italian straw as imported; and a specimen of the same made into plat in Great Britain. And as a proof that such plat will answer for the same purpose as the foreign productions, I have sent another piece equally as well knitted together, and in the same manner as such articles are made, as are commonly described by 'Leghorn hats.'

The process is to cut the ears off the straw with a knife, and to size (sort or select) them as to length and thickness. To cut off a sufficient proportion of the red and white ends so as to preserve as much as possible, an uniformity of colour. To take thirteen straws and tie them toon the right is to be turned down by the finger the top of 10. and thumb of the right hand, and brought up under two straws, over two, and under two, and seven straws will then be placed on the left side of the angle. Then the finger and thumb of the left hand is to turn down the seventh, or outermost straw on the left side, and to bring it up under two straws, over two, and under two, and seven straws will again be placed on the right side of the angle, and so on alternately, doubling and platting the outermost seventh straw from side to side, until it becomes too short to cross over so as to double on the other side of the angle :then to take another straw, and put it under the short end, at the point of the angle (middle of the plat;) and by another straw coming under and over the joined one, from both sides of the folds in the edge of each piece alternately, as angle in the operation of platting, it will become above described. The needle is pushed on two fastened; the short end being then left out under-or three folds at once, till nearly the whole of it neath the plat, and the newly fastened straw taking its place on that side of the angle to which the short one was directed; and so continue, repeating the joining, doubling and platting, until a piece of twenty yards long (more or less,) is completed. See fig. 5.

The short ends which are left in the act of joining are to be cut off with scissors, and the article will be then the same as the specimen herewith sent for the use of the public.

I am, Sir, &c. &c. &c. JOHN PARRY.

A. AIKEN, Esq., Sec., &c. &c.

Mr. Parry's communication relates merely to the manufacture of straw into plat, but, as the method of knitting or sewing the straw together, according to the Italian mode, is not generally known, the Society instituted an inquiry into this

particular. This part of the business is done principally by Italian jewesses resident in London, and is described in the following figures.

Fig. 1 is a piece of plat of twice the real size, showing the way in which the plat itself is form-

Fig. 2 presents two portions of plat four times the real size, partly knitted together, showing how the edges of one, fold over the edges of the other,

interested in obtaining employment for the poor ed line that characterizes the plat itself, so that

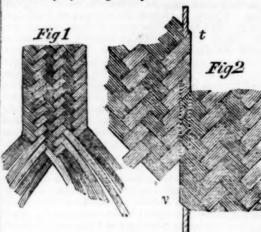

Fig. 3 shows two pieces that are knitted, but have been subsequently drawn a little asunder, gether at one end, then to divide them into a right in order to show more clearly the passage of the angle, placing six straws on the left side, and thread. It is first inserted under the straw 1. seven on the right. The seventh or outermost then under straws 2, 3; 4, &c. till it comes out at

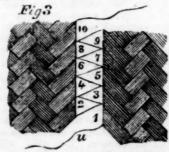

Fig. 4 shows two pieces of plat of the real size with the needle in the act of passing through the in the manner of a bodkin, leaving its place to be taken by the thread. If the edges are not thrust sufficiently close, the needle will miss some of the folds, and the junction though not visibly imperfect is really so. Sometimes, for expedition, only every other fold is threaded, which, however, is an injury to the work, as in this case it requires coarser thread to make the junction secure, and

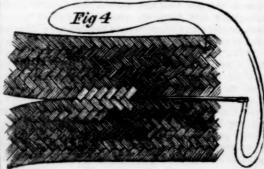

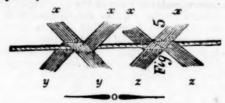

Fig. 5 shows the relative position of three loops x y z (x x being repeated,) with the thread trary direction from that in Fig. 3 for the sake of

WHEAT.

The great value of this grain, constituting, as it does, the staple of so large a portion of the agriculturists of the United States, and the material of one of our most important exports, will justify the space occupied by the following papers. It is important, as well to the natural history, of all plants, trees, grasses, grains, &c. as to the cause of justice in respect to the individuals concerned, that a correct account be preserved of the importation of such things into our country.-The introduction of a single fruit into a country, has justly immortalized the name of the individual by whose agency and public spirit it has been done, and so far as the American Farmer may hereafter be relied on as authority in such cases, it is our duty to record all material facts as we receive them, although they may sometimes prove uninteresting to the mere practical reader .- Ed. Am. Far.

TO THE EDITOR OF THE AMERICAN FARMER.

Auburn, Cayuga County, N. Y. June 29th, 1824.

SIR: - About four weeks since I accidentally saw at the house of an acquaintance, the first number of the sixth vol. of the "American Farmer," of March 26, 1824, edited by you, containing an address of Hugh Holmes, President of the Agricultural Society of the Valley, (I presume in Virginia,) delivered on the 6th of March last.

In that address Mr. Holmes refers to a communication received from Elkanah Watson, Esq. or three folds at once, till nearly the whole of it formerly of Berkshire, in Massachusetts, but now is concealed in the folds, it is then drawn through of the city of Albany in this state. in which Mr. of the city of Albany in this state, in which Mr. Watson alludes to a wheat imported by him from Spain in 1818, called "hard white wheat," and which he says " is now successfully cultivated in some of the western counties of the State of New-York." In Mr. Watson's communication to Mr. Holmes he did not intend to state any facts but such as he believed to be true, but he has either deceived himself or been deceived by others-no therefore, small elevated lines appear on the wheat has ever been successfully cultivated in surface of the plat, indicating the place of the this part of the state, from samples imported by thread and injuring the evenness of its surface, a Mr. Watson-experiments have been made upon defect which detracts from its beauty, and the whole, and all have proved to be inferior.—
But there is a wheat called the "white flint wheat," that was introduced into this country in 1812, from the State of Pennsylvania, which is considered by our farmers as a great aquisition, and is now cultivated largely in this and the neighbouring counties,-It succeeds well in inferior soil; is not affected by the rust; and in a great measure resists the Hessian Fly, though not en-tirely—nor does any variety of the triticum do so effectually.

I send you a small sample of the white flint, any quantity of which might be obtained from this county for seed the ensuing fall by the way of the Canal. If your people wish to try the ex-periment, they might write to Jesse Buel, Esq. of Albany, and I am sure it would give him great pleasure to render good to his agricultural bre-thren in any part of the world—and it would give me great delight to be in any manner useful to my native State, (Maryland.)

I will send by the mail that takes this forward to

you two papers containing some statements relating to this wheat. Yours sincerely

J. L. RICHARDSON.

From the Cayuga Republican.

I have thought best to send you the best account remarkably well. ground or root, where the fly lodges in other wheat. There were several small pieces in my neighbourhood last season, and not one of them were injured by the fly, when many fields of the spectable farmer near Levana, in this county, has a neighbour of Mr. S. Yours, and not one of them were injured by the fly, when many fields of the spectable farmer near Levana, in this county, has a neighbour of Mr. S. Yours, and not one of them were injured and some enclosed the spectable farmer near Levana, in this county, has a neighbour of Mr. S. Yours, and the state of other kinds of wheat were injured, and some en-tirely destroyed. The white flint wheat grows remarkably rank, and in most soils three pecks of seed is sufficient for the acre; it yields from 25 to 40 bushels per acre, and weighs from 60 to 64 pounds to the bushel; it is apt to lodge in heavy storms, but the berry does not spoil or sprout, as other wheat generally does, it ripens sooner.

Various reports have been circulated as to the origin of this wheat; I have taken some pains in this and the adjoining counties, to come at the truth. I find a new wheat was discovered in the neighbourhood of Rome, a few years ago, which from the introduction of this now highly prized resists the fly; it is commonly called the swamp variety of white wheat. Mr. Sebolt was an humand not so soft as the wheat in Cayuga Co. and on comparing the berry is not as white nor as heavy as the flint wheat. I have ascertained to my satisfaction, that our county is indebted to Elkanah the former of agricultural societies in this and other states. In the summer of 1818, Mr. Watson attended our agricultural society, at Auburn, and left with us a number of kinds of wheat which and left with us a number of kinds of wheat which it was said he imported from Spain, which was farm in Scipio, that fall. In 1815, Mr. Coe prodistributed through our county, and I have no doubt from this fact, that this wheat is one of the left with us and one of the 17 varieties. kinds he left with us, and one of the 17 varieties mentioned in the back of Mr. Watson's book, and which he imported from the south of Spain at ed patriot and Farmer's friend.

Brutus, May 14, 1824.

The subscriber having cultivated the above wheat, and being acquainted with the main fact. stated above, concurs in the opinion expressed relative to the said wheat; and from further obsergrowth, is the sandy or loamy kind. B. TUTTLE.

Auburn, June 8th, 1824.

JOHN H. BEACH, Esq.

Dear Sir-In answer to your note of this morning, requesting of me a communication of all the facts in my knowledge of the time when, and by whom the White Flint Wheat was introduced Esq. a respectable farmer of this county, which into this country, as also, my opinion of its comparative value with other wheat now generally cultivated in this county, has been duly re-

told me that he saw it cultivated in the state of New-Jersey, about two miles east of the Delaware River, near East Town, thirty seven years since; and Mr. Joel Coe, now of Springport, a farmer of known worth and integrity, has assured the state of Connecticut, in the years 1777 and 1778; and that in 1779 he removed to the state of New-Jersey, and never saw the wheat again, until he obtained a sample for seed in 1815.

This community are indebted to Mr. Henry Sebolt, late of Scipio, for all the benefits derived variety of white wheat. Mr. Sebolt was an humwheat; it has a white berry, and the stalk is solid, ble, obscure German, from the state of Pennsylvania, but a man of great personal worth, and considerable enterprise. In the summer of 1812 he went to the city of Washington to procure a ty for the last two years.

vation, is satisfied that the soil best adapted to its on the subject of the white flint wheat, and of which

him. He was an active member of the Agricultural Society of Cayuga county, in 1818, and could, from inquiry, if not from recollection, very easily have ascertained to whom the wheat mentioned in his communication had been distributed, how cultivated, and with what success; per-haps he has done so; but the public are favoured by him, with no facts, except the allegation that In the summer of 1818, Mr. Watson attended our Agricultural Society, at Auburn, and left with us a number of kinds of wheat, which it was said he imported from Spain, which was distributed through our county, and I have no doubt from this fact, that this wheat is one of the kinds Sir:—I am frequently asked about the quality ceived, and I do not feel at liberty to conceal any from this fact, that this wheat is one of the kinds of the new White Flint Wheat, which has been fact relating to that inquiry, which has come to he left with us, and one of the seventeen variecultivated in this county for two or three years my knowledge well authenticated. I regret, ties mention in the back of Mr. Watson's book, past, with great success. I have this year about five acres of it, which looks uncommonly well; I the comparative value of the white flint wheat think from appearance, it will yield about one from actual experiments, not having myself yet may have convinced my have con think from appearance, the harvested any of that grain, but hope in a few hend no other person. Mr. David Thomas, of same time. To satisfy the public anxiety on this subject, having now growing about 25 acres, which looks cultural Society in 1818, and from him I have ascertained the fact, that he cultivated every varieof it I can give, as it will prove a great benefit to our country, for two reasons: the first is, that it those who have cultivated it for several years, amounting in all to the number of seven-is proof against the Hessian Fly. Although the past in this county, is not a Spanish wheat of mothers and found them in his opinion, inferior to straw is uncommonly soft, yet it is a singular dern introduction into this country. Mr. Jehiel those in common use, and he has not since refact, that it is solid five or six inches above the Clark, a very intelligent agriculturist of this vi-newed the experiment. Current,

CELEBRATION AT NEW YORK OF THE BIRTH-DAY OF LINNÆUS, 24th May, 1824.-(Concluded.)

To DR. SAMUEL L. MITCHELL.

Linnæan Garden, May 24.

DEAR SIR-A most curious and singular natural phenomenon having occurred in this garden, I do myself the pleasure of addressing you on the subject; the more particularly, as it was from you the information was received, which led to the experiment. During a walk with you in my garden, about two years since, you mentioned to me, at the moment we were passing the dictamnus rubra, that a German writer had asserted, that the dictamnus or fraxinella, when in flower, emitted inflammable gas to such a degree, that on a lighted match being applied to it, it would im-mediately explode. This assertion of the German writer, appeared to me so incredible, that I had not the curiosity, the first season, to test its truth; but the last summer, observing some fine spikes of flowers on the plant, I went, with seve-ral of my family, in the evening, to try the experiment. A match was lighted and applied to the top of the flowers, but no effect was produced; the match was then applied to the base of the flowers, and instantly the whole spike was enveloped in a blaze of light, attended with an ex-plosion similar to what would have been produced by a tea-spoon full of gun-powder, thus proving beyond the possibility of doubt, that the assertions of the German writer alluded to, were correct. The next morning, I had the curiosity to examine the flowers, to ascertain if any visible traces remained of the explosion of the gas, but found none, nor could I perceive, that the flowers were in the least injured in beauty or appearance, This plant, well known in medicine, was esteemed by the ancient Greeks a radical cure, and Virgil quotes it in several places as remedial in ous Acid, which some call the "Acid of Wood," the leather thus manufact wounds. As its medicinal properties are fully defined in several of our modern materix medicx, not been long known; but in a folio work on experimental philosophy, written by Glauber the may be applied is that of I deemed it unnecessary to make any experiments on that head; but to you and to any other scientific gentlemen, I will cheerfully impart, any quantity of the plant they may desire, for the purpose of making experiments on its medicinal siriture.

But the most valuable use to which this acid may be applied, is that of curing meat of every description, so as to preserve it from flies, and the purpose of making experiments on its medicinal siriture.

But the most valuable use to which this acid may be applied, is that of curing meat of every description, so as to preserve it from flies, and the purpose of making experiments on its medicinal siriture.

With the highest respect, your's, &c. WM. PRINCE, Sen.

ODE TO LINNÆUS.

By J R SUTERMEISTER, of Rhinebeck.

Hail the bright reign of May! There is sweetness in her smile; The wild bird's song is gay-Its music doth beguile: The flowers, which adorn The green earth's loveliness, Which drink the breath of mora, May well the bosom bless.

Hail the bright reign of May, Fair daughter of young spring Hail this auspicious day, Which fleets upon time's wing! There is glory in its name,
The birth-morn of the high; His am'ranth crown of fame, Lives in the vaulted sky!

While in life's youthful dawn, He slept on earth's green breast,
The breeze swept o'er the lawn—
The flowers in joy were dressed.
Beneath an elm tree's shade, He lay to fame unknown; Till genius passed the glade, And claimed him for his own-VOL. 6.-21.

He walked the earth in pride, Like one born in the sky; Looked through creation wide, With philosophic eye. He named each shrub and flower, Which drinks the vernal dew; Which decks the summer bower With bright and varied hue.

Hail this auspicious day!
Young hearts with glory burn;— Lo! science takes his way, To greet its bright return : And learning's brow is dress'd, In smiling cheerfulness; How wakes each happy breast Where joy looks on to bleas.

Hail this auspicious day!
Bright cheeks are glowing here; Sweet beauty's fair array,
May well this hour endear. Oh! woman is life's flower, Which doth the heart beguile; Who would not die this hour, To live in beauty's smile !

Thou, the High-Priest of Nature !- for 'twas thine To stand within her sanctuary's veil;
To catch revealings from her secret shrine,
And tell the listening world the mystic tale!
We come, with grateful bosoms beating high, To gaze upon thy features: 'neath that brow, Dwelt the vast thought, that grasped infinity, And the firm soul that fortune could not bow! Bring Glory's wreaths, to crown the immortal sage
Not gemmed, nor golden be the diadem;—
But those bright heralds, that from age to age
Transmit his fame,—Oh! weave the wreath of them!

On the uses of Pyroligneous Acid, read at the all other acids. celebration of the birth day of Linnxus, at It is likewise Flushing, on 24th May, 1824.

ther, as to this discovery, than to ascertain that formed is applied by immersion, or by the brush. its qualities resembled those of common vinegar.

he obtained a prize on that account from the ly sweet, fresh, and fit for use. Royal Society of Gottingen.

Our journals also have me

Wood was generally regarded as a distinct acid; of meat, and the result has been equally satisfacbut Fourcroy, and other French chemists, ha- tory. But nothing has appeared of a positive ving analyzed it, they pronounced it to be the same as the acetous, or common vinegar, differing only in the flavour. The name of Pyroligneous one instance, the acid was put into the tub after Acid has since been given to it from the circumdistillation.

In England and France the manufacture of this acid is carried on to a considerable extent, and is there used in families as a substitute for vinegar. When it first comes from the still, it is of a dark colour, possessing a strong acid, and slightly astringent taste, with an empyreumatic smell-After remaining at rest for some days, the substance which causes the dark appearance, and which is of the qualities of tar, subsides, and the acid then resembles Madeira wine in colour, and is comparatively transparent.

Before Pyroligneous Acid, however, can be used for the table, it must be frequently distilled to free it from the volatile oil which occasions the peculiar flavour attending it in its original state,-The most effectual method to render it pure, is to mix it with sulphuric acid, magnesia, and common salt, when running it through the still .-These frequent distillations increase its strength so much that it cannot be used for domestic purposes, until it is mixed with a large proportion of water. Some of the acid, thus purified, has lately been imported into this country, and is found to answer all the purposes to which vinegar is usually applied.

Pyroligneous acid is well known in Great Britain of late years, as an article of commerce.-It is there distilled for the purpose of obtaining the acid to dye cloth, and the charcoal for manufacturing gunpowder, which is always in request .-The common estimate is that a ton of nut wood yields about 100 gallons of acid, 400 lbs. of char-

coal, and 12 gallons of tarry substance.

This acid is also extensively used, in this and other countries, in the preparation of white lead. The powerful manner in which it acts on the metal in its original state must always induce the manufacturers of this article to prefer it to

It is likewise understood, that leather may be Flushing, on 24th May, 1824.

It has been supposed by many, that Pyroligneous acid, in a much shorter period than by the ordinary process, and that the leather thus manufactured, is equal, if not

similar result.

hands of persons who may not be altogether attentive to cleanliness—considerations which are dent, the following sentiment: of no small importance to those who are careful in regulating their household affairs.

Accompanying this communication is a piece of beef prepared by me about two months ago, and a part of the acid used by me on that occa-sion. The beef has been fully exposed during sion. The beef has been fully exposed during the whole of that period, and although the wea ther has not been so warm as is usual at this season, I have no doubt that it is unassailable by putrefaction or by flies in the hottest part of the year. When sliced and broiled, it relishes as

well as the best beef steak.

The acid is in the same state in which it was when it first came from the still. It is divested of its colour by subsequent distillation; but as this deprives it of its essential oil, the cause of the smoky flavour given to the meat, any alteration in its present state must diminish that flayour, and, probably, materially affect its anteseptic qualities; consequently render it unfit for

curing meat.

I have been assured that fish may be preserved for any length of time by the Pyroligneous acid. The following resolutions having been laid be-This appears extremely probable. Salmon, shad, and herrings are cured in smoke houses in the same way that meat is cured, and there seems no reason to doubt that the acid would produce a similar effect. It might also be used to preserve beef and pork for a considerable period, without

REPORT OF THE COMMITTEE.

Which was unanimausty adopted by the whole Board.

The Committee of the Agricultural Board of Trustees to whom the resolutions of a former meeting were referred, return the same to the Board accompanied with the following report.

It is to excite emulation, and industry, and zeal among the tillers of the earth-to improve lands, and augment crops-to add to the wealth and strength of the country - to improve the household arts, and multiply the comforts of men, that agricultural societies are formed, and are conducive. Under this impression your committee have cheerfully given their attention to the subject submitted to them.

The first resolution directs an enquiry into the improvement made in the arable lands of the Eastern Shore of Maryland, and the kinds, the application and comparative value of manures

made use of.

The second resolution contains an invitation to our agricultural brethren in the different counties of this Shore to unite their exertions with ours for the purpose of producing a joint and more satisfactory result upon subjects connected with agriculture; and it also suggests for their posed by Nicholas Hammond, were unani-consideration, what has been found by this Board to be an eligible and agreable mode of pursuing that enquiry, and of attaining the most

The third resolution expresses a wish, and proposes to the several county boards that may be formed in pursuance of this plan, to meet annually where the Cattle Show for the Eastern Shore of Maryland is held, to confer together -and as far as can be ascertained, the compara- and arrange whatever plans may be thought

them shall seem useful.

After reflecting upon the different subjects of mers in the different counties of the Eastern these resolutions, your committee are of opinion, Shore of Maryland, to organize an association of that their objects are highly important, and if judicious and experienced persons consisting of carried into effect in the spirit in which they are

which to attain positive results. Tis true, that repay your kindness and remunerate you for your has been peculiarly blessed-two-thirds of its is scarcely an individual who does not enjoy a comfortable independence. Of knowledge, there is indisputably as large a proportion of sound useful information, and practical good sense, as will be necessary to effectuate any purpose or design, which we shall ever be disposed to execute. It is not essential that our communications should be drafted with classical purity or logical precision; or that they should be couched in the language of the accomplished academician. A homelier garb accords as well with our feelings, and the objects of an unassuming profession. No the objects of an unassuming profession. No man should ever be ashamed of placing his mite on the altar of the public good-diffidence and a reluctant timidity should never restrain the expression of opinions, predicated on experience, or offered as theoretical suggestions. A single fact, in plain and humble prose, the offspring of a pure heart, will ever be as acceptable as a thousand well turned periods, decorated in all the pomp of rhetorical embellishment. It would thus appear, that there is no deficiency in the two most indispensable requisities on which the usefulness and permanency of an institution essentially depends. If zeal and industry be now our determination—if we are resolved to break the talismanic wand of indifference, and to arouse from our lethargy, it needs not the aid of prophesy to foretel, that a happy issue to our labours will be our certain and sweet reward. That this society may flourish beyond our most sanguine anticipations-that it may tend to ameliorate our condition, and to promote the prosperity of our beloved country, is the reiterated prayer of one who will never cease to devote his time and humble talents to aid the great cause of agriculture and domestic economy.

All which is respectfully submitted.

W. B. SEABROOK. Edisto Island, S. C. July 14th, 1824.

On the Manufacture of Straw and Grass Bon-

nets.—No. 4.

Thus we see, that although one of the two ladies who made the important discovery of the conversion of a native grass into a costly bonnet, was suffered to pass with empty praise, by all the patriotic Societies in the United States, her labours have been made one source of national wealth to England, and that from a consciousness of their importance, and as a grateful re-turn for her liberality of conduct, she has been generously rewarded by the London Society. We see also that Mr. Parry, one of their own countrymen, has been complimented with the large silver medal for the manufacture of Leghorn plat, from straw imported from Italy: and lastly, to prevent all interference with home industry in the manufacture in question the Go-

the New Tariff are authorised in saying, as they morial to Congress against it, "that the statesupon principles of perfect reciprocity.

Miss Woodhouse to the London Society, and be introduced, or the causing of one Leghorn hat five hundred and forty-two thousand, three hunthen to try experiments with other native grass to be kept out by an English one, are ten thou-dred and twenty-five dollars. considerable distress.

If the teeth should be loosened by external violence, they may again be fixed, by pressing them firmly into the sockets, and preserving them in that situation either by a silk or other ligature attached to the adjoining tooth: the patient, however, ought to subsist entirely on spoon-meat, or other soft and liquid food, till the desired effect be attained. But, where this separation arises from a sponginess or weakness in the gums, mild astringents, such as a solution of alum and sugar, tincture of bark, catechu, &c. will serve to consolidate the surrounding parts.

For cleansing and preserving the teeth, burnt bread, or bark, applied by the small finger, or on a piece of calico, will be found a safe and useful dentrifice.— Tegg's Book of Utility.

With me, however, the moral as-sociations of West Point preponderated over the admiration its natural beauties excited. My mind recurred involuntarily to the memorable in-cidents of the revolution connected with the pay, rank and emoluments of a major, two assistant engineers with the pay, rank and scenes around me: I could not but remember the emoluments of a captain, two other assistant en-We left Philadelphia at 6 A. M. and at 3½ P. bold and reckless treason of the avaricious Argineers with the pay, rank and emoluments of M. arrived in New York, by what is called the nold; the romantic and ill starred enterprise of first lieutenants, and two other assistant engineers BUONAPARTE, ex-king of Spain; who has, like a Cato-like firmness of Washington; and I was dollars per month, and two rations per day. This almost ready to conclude, that the Deity himself corps so organized formed the military academy. had selected the sublime grandeur of this, then, The same law also provided that the president uncultivated wilderness, as an appropriate thea- at his discretion, when he should deem it expetre, where the human soul might conceive its dient might augment the corps of engineers to boldest designs, and display its highest passions, one colonel, one lieutenant colonel, two majors, There appears too to be a peculiar fitness in de-four captains, four first and four second lieutendicating it now, to the cultivation of the sciences, ants; and that promotions should be made in the and especially to the study of the art of military said corps with a view to particular merit withdefences. There is said to be a secret charm out regard to rank, and also that the senior offipervading mountain scenery which fosters the cer of the corps of engineers, should be the sulove of freedom, and the very ruins of the old perintendent of the military academy; and in his battlements that still crown the surrounding absence the next in rank. Shortly after a teacher of the French language, and a teacher of ments of patriotism, exhorting the young soldier drawing, was added to the institution, at this time to remember and to emulate the valour and the the cadets of engineers and artillerists amounting in all to 40, were assembled at West Point for in-struction. The officers of engineers were then here dwell upon the exact discipline, the enlight-obliged to perform the duties of professors, and ened system, and valuable objects of instruction continued to do so until the year 1811, when an his double mission to Naples and Russia, the illustrious Pinkney, of whom I may repeat, as to the force of his eloquence, what has been said of an orator not his equal.

The Caters, the Caters, the beautiful specific piny, with one assistant; one professor of engineering, with one assistant; one professor of the drawings, the noble Library of many mathematics, with one assistant; and a sword the force of his eloquence, what has been said of lies, the enchanting musick, especially of Mr. establishment of the academick staff; and the Willis, West bush of the assistant of the professor of engineering many many mathematics, with one assistant; one professor of engineering many many many mathematics, with one assistant; and a sword mathematics, with one assistant; one professor of the sword mathematics, with one assistant; and a sword mathematics, with one assistant in the sword mathematics, with one assistant in the sword mathematics, with one assistant in to which, if it were easy to do justice it would be sent to the military academy as students and of the line. Finding that there were other pro-Suffice it for this occasion to state that from the fessorships necessary for the accomplishment of At Brooklyn too, we saw with a feeling of vemeration, "old IRON SIDES" reposing on her laument, I felt anxious to ascertain with certainty its for fulfilling the objects of the institution, the rels, as if satisfied with having dispelled the origin, rise, and progress, which I do not remem- present secretary of war, added to the staff, charm of British naval invincibility, and demonstrated the moral truth, that, other circumstances fortunately I met with an old officer who had long mistry, mineralogy, and geology, with an assistant equal, the spirit of conscious freedom alone, can been a member of the institution, and from whom taken from the graduates of the institution. The give that supernatural animation to the heart, I learned that the Military Academy was first chaplain to perform the duties of professor of

ethicks, geography and moral law; an instructor of tacticks, an experienced officer to command the corps of cadets, with two or more assistant instructors, lieutenants who had been graduated at the military academy; also an instructor of artillery. And I understand that it is contemplated to add to the establishment an instructor of cavalry, with a suitable number of horses to teach equitation and to instruct the cadets in the cavalry exercises, and those of the light or horse artillery. This last addition will complete the institution and render the school one of the most perfect of the kind in the universe. As we have no cavalry belonging to the military peace establishment, perhaps on account of the expense of maintaining the horses, and the little service which cavalry can render in time of peace, the instruction of the cadets in cavalry manœuvres and exercises, may be considered very important, as it will enable the government in time of war to have recourse to graduates of the military academy for a competent establishment of officers to form a corps of the students receive their month's pay as if in cavalry. The secretary of war has directed, we the regular army, amounting in the year, for understand, a system for the cavalry to be comeach, to 336 dollars, which is adequate to all expiled, and the work is actually in the press .-Thus this valuable institution will become the nucleous of military fame, composed of every arm necessary to forming a complete army, and will furnish at the same time, officers well instructed in every branch of the sciences.

It went into operation under General Jonathan ened men, prepared by their habits of early and

Williams, whose likeness is suspended in the Li- strict subordination, to make good citizens in brary; as are also full length likenesses of Wash- time of peace, and by their scientific military brary; as are also full length likenesses of Washington, and Jefferson-the latter taken recently, by Mr. Sully; and a speaking resemblance of Mr. Calhoun, with whom the academy is understood to be an object of especial favour and solicitude. In making choice from the great number that apply to be admitted as students, a preference is, and ought to be given, to the sons of Revolutionary officers, and of the deceased officers of the late war. If, unfortunately, this establishment should become subservient to the convenience of wealthy men, who can well afford to pay for the education of their sons; or should it be found most accessible to the sons or wards of men of high political stations and influence; an abuse to which some jealous politicians have apprehended it may be liable, it would deservedly lose its character, and, with its character, its existence.

The number of students is limited to 250, and none are admitted above the age of fourteen; penses, and relieves their connexions from all charge for the time they remain. The whole establishment costs \$115,000 per annum. In re-turn for this expense, the Government secures for the command of our armies, and the defence of our country, a great number of highly enlight- perusal of the following

acquirements, to develope and wield with effect, the physical resources of the nation in time of war. In fact, we are already beginning to gather some of the valuable fruits which this well conducted establishment was designed to distribute throughout the States. It begins to furnish for our colleges, and schools, the best Professors of the exact sciences, which are here taught in their highest branches, and greatest perfection; even AGRICULTURE herself, will soon acknowledge the more direct interest which she has in the prosperity of a school which has enabled and will still further enable the Secretary of War to afford, at her call, accomplished civil engineers, fully prepared with the implements and the science, to make surveys, and digest plans for ROADS AND CANALS; those great channels so necessary and so well adapted to expedite and cheapen the transit of agricultural productions to their best markets; and to serve as the means of national defence. In short, the ways and the means of diffusing general intelligence, of amassing national power, and of providing for the common good.

That the military academy at West Point is fitted to make such men, and to secure such results as I have stated, you will the better see by

readers, but if you do, you may promise them that it follows, that the great object of improvement cut for the sheep. with you, is to endeavour to surmount as far as larger flocks. Certainly your winter food must be all got up and stored, and your flocks must be managed farm in this county-and which I have yarded with moderate shelter, and sufficient litter; also, it will follow, that you must undergo system be rightly managed, I think it may afford sometimes scalded. sufficient profit to the cultivator, besides adding, as it spreads, an important increase of national

With the above object in view, the first natural step is, to consider of a rotation of crops the spring, when it is dry enough to work, scarify adapted to the design. It is not necessary to suppose, that the plan, and the rotation, should em-the tilth lie to grow green (as I suppose it will) brace all the land in the farm; on the contrary, it seldom happens that the same rotation of crops your manure should be carted to the field, and is suitable to all the land in a farm of four or five M. Ely, Esq. the certificate of the honour you hundred acres. If, with you, a farmer had but have been pleased to confer on me, for which I two hundred acres of cleared and cultivated land, beg, by these presents, to return my most sin-cere and grateful thanks. As a member of your small part, as from 20 to 40 acres, taking the sheep, will go at least three times as far as if beg, by these presents, to return my most sin- yet he must confine his turnip husbandry to a respectable body, I hope I may, without offence best soil, and confining his exertion to the neces-they were eaten on the land.

small inclosures, or in one good field, divided by imaginary lines into equal portions. The rotation I would recommend, may be thus considered:

If of three years, on three, five, seven or ten acre fields, or compartments, the land would do cause there would be nothing to depasture; the

1st year. Turnips and other roots and plants, for winter feed.

2d. year. Indian Corn, summer tilled for wheat. 3d. year. Wheat. The stubble autumn ploughed for turnips.

If this rotation extend to three ten acre fields, I think the occupier may keep 50 breeding ewes, and winter them and their hoggets in separate yards, because the hoggets require the better keeping. In summer, when the ewes have lambs, they may be used for folding, on the land intended for turnips; but the hoggets now shorn, must still have the better keeping and be encouraged to fatten; when pastures fail, on the approach of winter, it will be necessary to give them some grain, and get them fit for the butch-

In the first year of the above rotation, every possible exertion must be made to get a crop of roots, but the attention is not to be confined to turnips, because they may miss; and besides, they are not well adapted to a warm climate; however, by choosing your cooler soils, you would partly obviate this objection. The outset would be more difficult, while the flock had not been wintered, and manure were scarce. Some of the following, which are all good, may do better with you than common turnips: yellow Scotch turnip, Swedish turnip, Hungarian turnip, Kohl Rabi, Mangel Wurtzel, Scotch Kail, Scotch Cabbage, Savoys, and Potatoes. All, or several of these, should be cultivated in your turnip fallow, and consumed in the order of their keeping

1st. The Scotch Cabbage, which is admirable

lightly compressed, by treading,* and covered It is much easier and more lucrative to send wool, scribed as the main object of your farming ope-with earth, if it could be got. When your tilth is mutton and beef, to market, than corn, rye, oats, rations, your old field system would become one fourthly, sow Swedish Turnips early in June; duce from 50 to 60 bushels per acre. and lastly, the common Turnip. The land must receive another ploughing for the turnips, and In the foregoing, or turnip system advantage should be taken of rains, in sowing and planting.

The seeds of Scotch Cabbages should be sowed in the middle of August, and the plants pricked out on beds, to stand the winter; otherwise the cabbages will not arrive at a good size; ex-perience guides in these things. The Kail and Savoys are to be sown in Spring, and drawed for planting in the beginning of June. The Hungarian Turnip, and Kohl Rabi, (both Spring sown,) bear planting as well as cabbages; but the Mangel Wurtzel, and Swedish Turnip, are better sewn in drills, and thinned by hoeing. I have here been unnecessarily minute, but I would press on your attention the importance of culti-

crop.

The rotation already stated is very short, and would be found to require great exertions in manuring for turnips; but the rest of the farm would contribute to the quantity of manure without receiving any, as will presently be shown Both sanfoin hay, and clover, should be had for mowing, and the eddishes of both for eating; and if the sail be good enough, as far as the above turnip system is attempted, the rotation may better include four compartments, as follows:

1st. year. Turnips, &c. as before.

2d. year. Indian corn, summer tilled for wheat. 3d. year. Wheat, sown with clover in Spring. 4th. year. Clover, the soil turned down in Autumn late, if possible, for turnips, as at first.

In this rotation the clover is too far from the manure, but you may help it with gypsum. The rotation, however, could only succeed on good

land, and with able management.

I have long considered it an important object with you, to try Talavera wheat, spring sown, to escape the ravages of the Hessian fly. I believe, Talavera wheat, sown with you in April, would ripen in August, and being in a later stage of growth in the middle or latter end of May, when the fly strikes it, might thereby remain safe. The following rotation would suit this object:

(Still within the turnip system)-

1st year. Turnips. 2d. do. Talavera wheat.

3d. do. Clover. 4th. do. Indian Corn.

This rotation is certainly preferable, if the Talavera wheat succeed, but it will not pay you to of fallow for turnips. They can neither procure the Hessian Fly, to which I beg to call your parput oats or barley instead of wheat, on this, your best land. By one or other of these rotations, ably conducted, you may have a turnip system, adapted to your climate, and if your farmers, in gene-nips. 4th. Barley. 5th. Seeds. 6th. Seeds. public; but I should suppose not, because the ral, will only learn by degrees to pursue it, to (two grass years.) 7th. Peas. 8th. Wheat. You same remarks, taken as true, have been in subthe extent of wintering 100 sheep, and shearing would want manure to Nos. 1, 3, and 8, besides stance inserted in the late "Introduction to En-100 fleeces on every farm of 150 or 200 acres of the impossibility of consuming your turnips (if cleared land, it would progressively make an im- you get them) on the land. portant addition to your agricultural property,

made, as above, cart your manure on the land-it and barley, which should only be raised for home renewal only, by sowing seeds upon the wheat, having been turned over to lie a fortnight or so, to consumption, and to increase manure. Consider and letting the land lie on again. Thus the land become short; and when your annual weeds ing the downfall in the prices of breadstuff, &c. would come to the fallow again periodically, in have well vegetated, plough in the manure and it is a miserable practice to keep large breadths better condition, and your old field wheat crops them together. Having in the interim planted of land in a coarse tillage, and reap little crops would improve. your corn, after this ploughing (suppose in the for much labour. Your wheat land, in the turnip middle of May,) you may immediately plant system, sowing three business per act, may your potatoes, suppose an acre; Scotch Cabbaduce 24 bushels; thus ten acres of wheat, may land but that which is, in its turn, within be equal to 20 in produce, (by the old method,) your turnip system. In your old field system it

Of the old Field System.

vating several sorts of food, both as to the division of labour, and the probable success of the crop.

The rotation already stated is very short, and but some fine pasturage. When your oldest ley is broken up, and will succeed on land not good enough for white summer fallowed, sow it with wheat, or wheat clover. We frequently add trefoil to other and rye, (because some rye you should have,) seeds, and sometimes sow it alone, or with rye-but sow it in spring with santoin, or with such grass. Your timothy is not calculated for hilly go from wheat (the stubble autumn ploughed) to them true and clean; otherwise it is an excel-spring tares; these may be folded off with sheep lent grass for leys. in summer, and the fourth year sow spring grain There is no grass but the varieties of holium with difficulty practicable on any of your lands, like corn, and can be afforded cheap, and in any and where the turnip system is introduced. I quantity. Neither is there any, excepting cocks-should prefer always sowing sanfoin, trefoil, white foot, which is adapted to such various soils; it clover, improved raygrass, and other seeds adapt-ed to the soil, and as prudence dictated, with the first crop after the fallow; I mean in the old ture; and here it will stand for permanent pasfield part, which must always be the much larger turage. But excepting your natural meadows and part of every farm.

ty generally, where the soil is good enough to pro of many ages, and the depasturing of flocks, duce it; and also, that you plough it down in au-from time immemorial; and for fattening beeves, tumn, for Indian corn to follow. Your rotation in you must depend chiefly on the stall. Neverthe-

this case, I canceive to be

1st. year. Fallow. 2d. year. Wheat. 3d. year. Clover. 4th. year. Corn.

But what follows the corn? If wheat, the rotation cannot be supported. Seeds cannot follow case, it appears that the land must return to a which case you may be sure of obtaining the poor and neglected state for a term of years. You cannot succeed in any lengthened rotation, which ought to be exploded. extending to all your convertible fields, as we do, because of the objections to the turnip system. What are your farmers to do with 30 or 40 acres in the present year, are two articles concerning manure, nor raise the crop, nor get it up and ticular attention. I do not know whether any furconsume it. If, as with us, your dryer soils were ther observations have since been made, or any cultivated by 1st. Fallow. 2d. Wheat. 3d. Tur-better information obtained and laid before the

by no means follows that you should sow all the fields, as they are renewed, with the same seeds. One piece may be more elevated, and poorer than In the foregoing, or turnip system, whichever the rest; here you must have sanfoin. Another rotation be preferred, I have said nothing of barley or oats; there will be persons enough trying acre, and a peck of the improved ray, or ryeto raise these on the old field system, long after grass, (which I call Russell-grass, because the oth-the better farmers have struck into that which is er name is absurd.) The old rye grass is bad, but more profitable. The old field system, (by which the improved varieties yield constant verdure, I mean that which is yet pretty generally in use and are very good. Neither is it indispensable with you,) is capable of great improvement in that your old fields should be broken up in reguthe simplest manner; in fact, your dryer soils lar order; the sanfoin ley, with the help of gypare very much injured by growing spring grain, and corn after wheat. By your turnip system, ver and Russell grass ley (being better land too) you will have corn, and for spring grains, they are very little worth; but your old fields must four years. Again—on another ley you may sow nevertheless be renewed, or you would lose your of Russell-grass, two bushels, and of rib-grass, sanfoin hay, and other produce from their pastu- four or five lbs. to the acre, which pasturage other seeds for hay or pasturage, as the soil is ordry soils, and the cocksfoot does not admit of best adapted for. Stiff or moist soils, may thus having its seeds dressed by wind, so as to render

with grass seeds. But I should think this rotation herenne, which bears seeds that may be dressed bettems, I believe you have but little land which I am very well aware that you sow clever, pret- is adapted to grazing; sheep-downs are the work less, by renewing your leys, and supplying yourselves with sanfoin hay, &c. and summer feeding, you may increase your neat stock as well as

sheep, and so add to your manure,

If you have not yet, I would advise you speedis ly to procure some of our Russell-grass, and shall have pleasure in executing any order to that corn, by reason of the summer tillage. In either effect which may be addressed to my office; in

Of the Hessian Fly.

In the Farmer's Journal, for July 1st, and 22d.,

^{*} That it may not heat too violently. But this is only when the manure contains much straw, or e long dung, as we call it.

^{*} I do not mention the timothy, because it cannot It appears, that your old field system does not be substituted. The dogstail and sweet vernal returns to a state of nature for a term of years; has light, chaffy, awned seeds, and succeeds only but by introducing the turnip system before de-on rich soils.

Cotton, the Leghorners do not want, for they raise what they require in their own country. But the cry is, that "the manufacturers will impose, and charge two prices if encouraged by increased duties on foreign goods."

The first method proposed may at first view gin to go to work; a fact which I state upon the most ample and satisfactory experience, very seldom having ever had any other sort of breakfast of was at work in the fields full four years before encouraged by increased duties on foreign goods. Blowing rock, greater security against damp, and Such fears are groundless. The fact of the high more certainty of finding a vain than a common lar pleasure to see a how instrumed of the high. Such fears are groundless. The fact of the high prices they charged during the late war, will not happen again; and even for those prices an apology may be offered, by referring to the well the first place the dirt to be removed is but about His father set him into the ridge at a great disknown fact, that farmers, planters and merchants, three times as great, as will be procured by only tance before him; and, when he came up to the always avail themselves of a scarcity in the artimaking a diagram of the hill; and in the second place, he found a sheaf cut; and, those who always avail themselves of a scarcity in the article they have to sell, by taking as much as they can get. The cotton planters themselves did not refuse at one time 50 cents a pound for Sea Island cotton, and 30 cents a pound for Upland: they would gladly get those sums again, but the game would gladly get those sums again, but the game is the common hand as fast as it is dug.

As to this mathed of Farding superstant facilities and in the second place, ne found a sheaf cut; and, those who place, instead of having to haul up the dirt by a know what it is to reap, know how pleasant it is windlass, at the great risk of the well digger, to find now and then a sheaf cut ready to their hand. It was no small thing to see a boy fit to be wheeled off along the level of the ditch, by a trusted with so dangerous a thing as a reap-hook in his hands, at an age when "young masters" would gladly get those sums again, but the game is up: nor did the Tobacco planters refuse in the is up: nor did the Tobacco planters refuse in the year 1818, \$110 and \$120 per hhd. for their to- for blowing rocks, and greater security against and to see that they do not fall out of window, bacco: they would take those sums to-morrow. noxious damps, than the common method; this sumble down stairs, or run under carriage-wheels or other domestic articles of manufacture are not It is attended with a greater certainty of finding ing his duty by this boy much better than he again to be expected, although protected by duty, for the invariable result will be, as long since cal medicines, paints, and many other articles well, for your ditch must traverse the whole of that might be mentioned, are in proof of both positions. The abundance of capital, the diminished sources for investing it, and the zeal of has nearly as many advantages as the first, and our citizens, are all powerful stimuli to active engagements in manufactures, and if the example of the statesman of the old world was adopted by those of the United States, of protecting in every possible way, home industry, they would soon flourish, and prosperity once more be restored to

200 WELL SPRINGS.

the country.

TO THE EDITOR OF THE AMERICAN FARMER.

Newbury, S. C. July 5, 1824.

SIR-Permit me to communicate to you a new method of digging wells, which in a hilly country makes them, in my opinion, superior to springs.

The method occurred to me some years ago, and I have often spoken of it as practicable, but I never heared of its being reduced to practice until lately. Mr. John Rhoden, of Chester, I am informed has in the course of the last year

made the attempt, and completely succeeded.

Mr. Rhoden had a well on the side of a steep hill, the cleaning and repairing of which had cost him much trouble and expense, to little purpose.

At length it occurred to him that if he could make a horizontal opening into it from the side of the hill, on a level with the vein, that he might a child wants. At a later age they furnish one I content myself, therefold shall only make meal a day for children. Milk is, at all seasons, dy been said on this subjunitaries.

the daughters and grand daughters of women few days, and he has now, out of his well, an ex- with milk instead of with water; and he will find

officers, and accepted as partners, their captive barrow, until you come to the vein. Or make, one, would, perhaps, find it best to make some in the first place, a horizontal opening, such as butter at any rate. Besides, skim-milk and bread Besides, is it not better policy to make this Mr. Rhoden did, into the vein, instead of digging (the milk being boiled) is quite strong food enough

water, because in the common method unless a would have been by sending him to a place called vein is found within the diameter of your well, a school? The boy is in a school here, and an pronounced by A. Hamilton, that competition you may continue to dig without success, although excellent school too; the school of useful labour will reduce prices even below those of the im-numerous veins may be running within a small I must hear a great deal more than I ever have ported article; and at the same time, the Ame- distance of you. But in the method I propose yet heared, to convince me, that teaching chi rican fabric will be far better in quality than the you will have a chance for every vein which runs dren to read, tends so much to their happine; foreign. Coarse muslins, hats, leather, chemi- from the outside of the hill to the inside of the their independence of spirit, their manliness

> some others: but these must suggest themselves at the first view, and require no elucidation.

> An excellent milk-house may be easily made in the excavation, under either method.

I will not dilate upon the advantages of this method of digging wells. Allow me only to re-iterate the superior facilities it affords for keeping them in order.

Many tracts of land, whereon there are no springs, loose half their value; because few would be willing to settle them, and undergo the trouble

Your's, most respectfully, JOB JOHNSTON.

When you plant out I think it is, as much butter in it, as the half pint that comes out first. I tried the milk of ten Al- Here they will stand the winter; and you must Yorks, then a row of Sugar-Loaves, and so on derney cows, and, as nearly as I, without being see that the slugs do not eat them. If any plants throughout the piece. Of course as you are to very nice about the matter, could ascertain, I fail, you have plenty in the bed where you prick-use the Early Yorks first you will cut every other stated. The udder would seem to be a sort of milk-pan; in which the cream is uppermost, and, hard, and bad for plants, you cannot cover 36 the Sugar Loaves are cut away, and in their place of course, comes out last, seeing that the drain rods; but, you may the bed where the rest of milk clean, the cow will give less and less milk, and will become dry much sooner than she ought. The plants, not to cover the leaves, will preserve will find about 16 rods where you and will become dry much sooner than she ought.

much food as a cow of another sort. For a cotoff pretty quickly. If those in the 36 rods fail, average, the fault must be in the seed or in the
tage, a cow of the smallest sort common in Engor fail in part, fill up their places, later in the management. land is, on every account, the best; and such a winter by plants from the bed. cow will not require above 70 or 80 pounds of good moist food in the twenty-four hours.

ground is what we want to know. It frequently when March comes, and the ground is dry, hoe be left there will, in April, serve you for greens, happens that a labourer has more than 40 rods of ground. It more frequently happens, that he has some common, some lane, some little out-let or grow, dig the ground with a spade clean and out than with. At any rate, the pig, which has other, for a part of the year, at least. In such well, and let the spade go as near to the plants as strong powers of digestion will consume this hercases he may make a different disposition of his ground; or may do with less than the 40 rods.—
Give them another digging in a month; and, if I am here, for simplicity's sake, to suppose, that he have 40 rods of clear unshaded land, besides one live a week. "Oh! what a deal of work? planting. Now, in the last week of May, pre-

drinks of 5 quarts of milk a day, on an average, seasons and soils; but, generally speaking, by the time with cabbage leaves, and take the leaves all the year round, he will not suffer his ground first of June you will have turned-in cabbages; off at night; hoe well between the plants; and, to amuse, really give nothing worthy of the name of food, except to the Blackbirds and Thrushes. The ground is to be clear of trees; and, in the Lay it in ridges in April or May about 2 feet weight per day, which is more than she would feet distances each way; and this will give you, apart, and made high and sharp. When the eat. But, you must use some at first, that are not over and above, 840 pounds weight of turnips weeds appear about three inches high, turn the solid; and, then some of them will split before For the other two rods will be ground enough for but in dry weather) and bury all the weeds. Do

if thicker) you will have a plenty. As soon as fairly out of ground, hoe the ground nicely, and pretty deeply, and again in a few days. When piece of ground. In November there must be, the plants have six leaves, which will be very arrived at perfection, 3000 turnip plants. These, ill taste to milk and butter. It is very certain, and the taste and smell of certain server of certain. weather may serve, a little earlier, or later, lay Swedish turnips.

found the difference to be about what I have ed them out; for your 36 rods you will not require row; and the Early Yorks that you are to plant the plants being "cut off," they have, in fact, Here the Swedish turnips will stand in rows at 2 their plants being "cut off," they have, in fact, Here the Swedish turnips will stand in rows at 2 nothing to complain of but their own extreme feet apart (and always a foot apart in the row;) sort will certainly require more than twice as ed of all his plants being cut off, I should cut him and, if these do not weigh 5 pounds each on an and, if these do not weigh 5 pounds each on an and if these do not weigh 5 pounds each on an and if these do not weigh 5 pounds each on an and if these do not weigh 5 pounds each on an and the fact.

116. Now, how to raise this food in 40 rods of plants, and rout out all slugs and insects. And out your cabbage plants. The plants that will

to be encumbered by apple trees that give him and soon you will have the Early Yorks solid .- when they are safe from the fly, thin them to 4 only the means of treating his children to fits of And, by the first of June you may get your cow, inches apart in the row. The 2 rods will give you the belly-ache, or with currant and gooseberry bushes, which, though their fruit do very well and at this time such a cow as you will want will than you will want. From the draw your not, thank God, cost above five pounds.

The ground is to be clear of trees; and, in the and of the manure and litter by-and-by. At pre-transplant none much before the middle of July, spring we will suppose it to be clean. Then dig sent I confine myself to her mere food. The 36 and not much later than the middle of August. it up deeply, or, which is better, trench it, keep- rods, if the cabbages all stood till they got solid, In the 2 rods whence you take your turnip plants, ing, however, the top spit of the soil at the top. would give her food for 200 days at 80 pounds you may leave plants to come to perfection, at 2 ridges into the furrows (never moving the ground you could use them. But, you will have pigs to you to sow your cabbage plants in at the end of help off with them, and to gnaw the heads of the August, as directed for last year.

stumps. Son.e of the sugar-loaves may have been 126. I should now proceed to speak of the manthis as often as the weeds get 3 inches high; and, stumps. Sone of the sugar-loaves may have been

(for some you must have,) and sow one half of it the ground and manure it, and, as fast as you cut ginning of my next number. After, therefore, obwith Early York Cabbage Seed, and the other cabbages, plant cabbages; and in the same man-serving, that the turnip plants must be transplantwith Early York Cabbage Seed, and the other cabbages, plant cabbages; and in the same manhalf with Sugar-Loaf Cabbage Seed, both of the ner and with the same cultivation as before. Your ed in the same way that Cabbage plants are; and true sort, in little drills at 8 inches apart, and last planting will be about the middle of August,

clean. Not a drop, if it can be avoided, should, some manure (of which I say more hereafter) 124. And now how are these to be had upon be left in the udder. It has been proved, that between the ridges in the other 36 rods, and turn the same ground that bears the cabbages? That

125. The Swedish Turnips are raised in this 119. If you find the ground dry at top during manner. You will bear in mind the four rods of the winter, hoe it, and particularly near the ground, in which you have sowed and pricked what his house and sheds stand upon; and that Well! but, it is for yourself; and, besides, it is pare a quarter of a rod of this ground, and sow it, he have nothing further in the way of means to not all to be done in a day; and, we shall, by-keep his cow.

Swedish turnip seed; and, sow a quarter of a rod 120. By the first of June; I speak of the South every three days, till you have sowed two rods. shaded; for, I am to suppose, that when a man of England, and there is also some difference in If the fly appear, cover the rows over in the day plants to transplant in the ground where the cab-121. I shall speak of the place to keep her in bages have stood, as before directed. You should

by the fall, you will have really clean ground, and not poor ground.

118. There is the ground, then, ready. About the 26th of August, but not earlier, prepare a rod of your ground, and put some manure in the serious planted out in the spring; and thus these 36 rods will get you to some time in September.

122. Now, mind, in March, and again in April, for her, the managing of the manure, and sevented of your ground, and put some manure is those in the fall. Dig up want of room here, must be reserved for the before we want of the manure is the ground and manure is t that both ought to be transplanted in dry weathe seeds thin in the drill. If the plants come up with stout plants, and these will serve you into ther and in ground just fresh-digged, I shall close at two inches apart (and they should be thinned the month of November.

soon, dig up, make fine, and manure another rod or two, and prick out the plants, 4000 of each, in pounds, and this, at 80 pounds a day will keep the food will do this; for, in some parts of America, rows at 8 inches apart and 3 inches in the row. cow 187 days; and there are but 182 days in these where the wild garlick, of which the cows are the ground between them often, and they six months. The greens will have helped out will grow fast and be straight and strong. I suppose that these beds for plants take 4 rods of ber; and, perhaps, into December. But, for these and butter. It is very certain, that the taste and smell of certain sorts of cattle food will do this; for, in some parts of America, rows at 8 inches apart and 3 inches in the row. cow 187 days; and there are but 182 days in these were the wild garlick, of which the cows are plants, springs before the grass, not only the milk ber; and, perhaps, into December. But, for these and butter have a strong taste of garlick, but seems the row of the row o sources. None can be more common expressions.

than, in Philadelphia market, are those of Gar-freach them. The seed will keep perfectly good per cent. more when well washed on the sheep ticky Butter and Garlicky Veal. I have distinct- for four years. ly tasted the Whiskey in milk of cows fed on distiller's wash. It is also certain, that if the cow eat putrid leaves of cabbages and turnips, the butter will be offensive. And the white-turnip, which is, at best but a poor thing and often half putrid, makes miserable butter. The large cat-tle-cabbage, which when loaved hard, has a strong and even an offensive smell, will give a bad taste grass of two acres and a quarter of ground, the Alabama the drought was severe, and the crops grass being generally cut up for them and given were said to be exceedingly bad. In many secthem in the stall. I had in the spring 5,000 tions of these states there will probably be a Cabbage plants, intended for my pigs, eleven great scarcity of provisions, and the cotton crops in number. But, the pigs could not eat half must fall very far short of an average production. their allowance, though they were not very small tion. when they began upon it. We were compelled to resort to the aid of the cows; and, in order to see the effect on the milk and butter, we did not mix the food; but gave the cows two distinct PUBLISHED IN THE AMERICAN FARMER, BY ORspells at the cabbages, each spell about ten days in duration. The cabbages were cut off the in this world. I never had better from cows feeding in the sweetest pasture. Now, as to Swedish turnips, they do give a little taste, (unless completely ripe, for which reason they ought not to be given till the spring;) especially if boil-ing of the milk-pans be neglected, and if the greatest care be not taken about all the dairy tackle. Yet, we have, for months together, had the butter so fine from Swedish turnips, that nobody could well distinguish it from grass butter. But, to secure this, there must be no sluttishness, Churn, pans, pail, shelves, wall, floor, and all about the dairy, must be clean; and, above all in this office. things, the pans must be boiled. However, after all, it is not here a case of delicacy of smell so refined as to faint at any thing that meets it ex-cept the stink of perfumes. If the butter do taste a little of the Swedish turnip, it will do very well where there is plenty of that sweet sauce which early rising and bodily labours are ever sure to bring.

128. The other point (about which I am still more anxious) is, the seed; for, if the seed be not sound, and especially if it be not true to its kind, all your labour is in vain. It is best, if you can do it, to get your seed from some friend, or some one that you know and can trust. If you save seed, observe all the precautions mentioned in my book on gardening. This very year I have some Swedish turnips, so called, about 7,000 in number, and should, if my seed had been true, have had about twenty tons weight; instead of which I have about three! Indeed, they are not Swedish turnifis, but a sort of mixture between that plant and rafe. I am sure the seedsman did not wilfully deceive me. He was deceived himself. The truth is, that seedsmen are compelled and they but too often pay very little attention to the manner of doing it. The best way is to get a dozen of fine turnip plants, perfect in all re-

TOBACCO.-Not much in market, Prices same s last report.

TO THE GROWERS AND Manufacturers of Wool.

The subscriber offers for sale a Tract of Land, in Fairfax County, State of Virginia, containing 10,000 acres, within ten miles of Alexandria, Washington, and Georgetown, and within two miles of turnpike roads leading to each of those towns. A considerable portion of the open land is divided into tenements of from one to three hundred acres, yielding a present income of from 1500 to 2000 dollars. The open land reserved is divided into two very extensive sheep-walks, a hog-range, a meadow containing upwards of 200 acres, and a farm of about 700 acres, the greater part of which is well enclosed, and divided into the necessary fields and lots by good post and rail fences. On the farm there is a grist mill, containing both wheat and corn stones; a saw-mill, a cooper's and blacksmith's shop, a small tannery, 8 or 10 labourer's houses, a manager's house, a brick barn 48 by 34 feet, a brick stable 56 by 38, and an apple and peach orchard, centaining together 2000 trees. The homestead consists of one of the most commodious buildings in the state of Virginia, fronting not less than 112 feet, containing 20 rooms, having all the necessary outhouses attached to it, and a garden filled with every variety of fruits and vegetables. The situlour, than these cabbages made, never was made April, 1824, and ending on the 5th day of July, ation is as healthy as any in the United States, and the whole tract is intersected by numberless water-courses; on one of which are four or five excellent sites for mills or factories, with an abundance of building stone immediately at hand. To a gentleman disposed to connect a system of tenantry with extensive grazing, or to a company desirous of going largely into the growth and ma nufacture of wool; a more eligible situation will hardly present itself. The subscriber will be happy either to see or to hear from any indivi-dual disposed to purchase the whole or a part of

W. H. FITZHUGH.

Ravensworth, near Alexandria, Aug. 12.
P. S.—Should the expensive improvements attached to the homestead be objected to, the proprietor would be willing to retain them, together with a farm of from two to four hundred acres, making a liberal deduction from them.

FALL RACES-MARYLAND ASSOCIATION for the Improvement of the Breed of Horses .- The Fall Races of this Association will take place at CANTON COURSE near Baltimore, on the 20th, 21st and 22d October next, for the following purses, free for any horse, mare or gelding, to carry weight, &c. agreeably to the rules of the Asso-

1st day, 4 mile heats for a purse of \$600 2d day, 3 mile heats for a purse of 3d day, 2 mile heats for a purse of 400 300

AGRICULTURE.

EXTRACTS FROM AGRICULTURAL ADDRESSES, &c. &c.

Moral effects of Agriculture.

It is remarked, that in all countries where Agriculture is the chief business of the people, are found the greatest simplicity of manners, more purity of morals, and the best display of the social virtues. By an attachment to the soil, the natural result of its culture, they become the best citizens, the best soldiers, and the firmest patriots. The mere which are natural to the country which gave him birth, and gives him bread; but, as he cultivates no land, he cannot feel that attachment to the soil lick spirit will unite with private interest, in so ture in the management of his offspring. peculiar to those who reap the fruits of their own labour. As he can quit his country, when in danger, with more facility, he will not be likely to cherish that deep solicitude for its welfare which the farmer feels, who considers his all at stake. Our statutes seem to recognize this fact. To be eligible to any important office in the Commonwealth, a freehold is the first requisite.

Communication from Ward Nicholas Borls—row, Eag. to the Corresponding Secretary of the Worcester Agricultural Society.

Princeton, Sept. 10, 1821.

Sir—Much having been written and said by agriculturists on the subject of improvements of grass lands, I determined to make various experiments on my estate at this place; and on part which appeared least likely to compensate for the land of the manuscript of our females, by the encouragement given to four females, by the encouragement of our females, by the encouragement of our females, by the encouragement given to four females, by the encouragement of our females, by the encouragement of our females, by the encouragement of the encouragement of the proper means of procuring alivelihood, send the unprotected, to resort that virtue has no dictation in.

We do not profess ourselves friends to the Tariff bill in extenso; but we presume that there are few persons who do not approve of some part of its provisions, and we think that nothing can be more proper than suitable encouragement to this particular species of industry.—We have seen the effects of straw plaiting, upon whole villages, in what the toils of the lands are found to be 644 lbs. giving an average of 92 lbs. to each cock, and a result of the quantity already stated, of 31 tons, 13 cwt. 1 qr. 8 lbs. gross weight,

dence of the beneficial influence of the Society on the agriculture of the county, but are also encouraged to hope that the time will arrive, when the common and ordinary animals of the country will equal the best exhibited for premium to-day. The Committee were highly gratified in being called on to view a fine display of Working Oxen, consisting of nearly sixty yokes, from the enterprizing town of Shrewsbury. It served to main-prizing town of Shrewsbury of the Society on the month of November last, I carted on a term) it inhales the manure which is kept moist tompost of about eleven loads to an acre, which by the grass, and is drawn down immediately to the nutriment and support of the weaker roots of the grass, as the experiment has proved from the sun, but open to light to the 19th of July, the day it was cut, when it stood up with a strong body, and measured 3 feet of over several times during the summer.

It may not be thought by many that it is of so the forezoing letter worthy of any attention.

I have the honour to be, with great respect, your obedient servant,

WARD NICH. BOYLSTON.

00

FROM THE UNITED STATES GAZETTE.

We invite the attention of our readers to the of competitors for premiums, in this interesting and very important part of the exhibition, this day witnessed.

Agreeable to notice, the ground had been previously divided into lots of an eighth of an acreeach: 12 competitors were present with teams, consisting of one yoke of exen each, and drew lots as follows:—

Lot No. 1. Nathan Heard, jr. of Worcester, Peter Williams, ploughman, John Armstrong, driving the rainy seasons, and producing large crops of communication in our columns, (the sixth numweeds, greatly exhausts the strength of manures. ber of which is this day published) upon the subsubday witnessed.

The result of this last experiment, being enject of the Manufacturing of Straw and Grass tirely of the compost here given, was that, on hats, in our country. They are furnished by a on this piece of land (which was carefully measured by Mr. Mason, an able practical surveyor; whose devotions to the public good, give him a claim to a respectful hearing. To all, this subsubday who might earn a competence, by this branch of blu to the certificate annexed, and probably who might earn a competence, by this branch of

Lot No. 5. Stephen Marsh, jr. of Sutton, Hiram I caused all the hay on the piece to be put into creditable employment is taken from the hands White, ploughman, Stephen Marsh, jr. driver—cake as equal in size as possible and then sent of our females, by the encouragement given to cocks as equal in size as possible, and then sent of our females, by the encouragement given to

vices await them; and the parents too often left to mourn over the wreck of virtue, which their poverty could neither prevent, nor remedy. We have, we say, seen the effect of straw plaiting upon such families, the production of the labourer's land, afforded the materials for his daughter's industry; the careful mother could watch over her children's conduct, and see her own examples and precepts insuring competence, respectability and virtue to her family. These fireside lessons, and this labour of the domestic hearth are the true sources of individual respectability and public wealth, for what in a republican government, is a national blessing, if it be not the promotion of individual happiness.

The introduction of Leghorn hats has again paralysed the exertions of the industrious females and families, that once enjoyed the neatness and comforts flowing from the competence which the aggregate industry of each individual afforded,

have alluded.

In former times of greater public prosperity, the exertions of the head of the family, were sufficient to give, not merely support, but ease of all was it found necessary for females to remore within the reach of females-and none more the congress of our country neglect to secure after these facts, is an insult to common sense. this means of industry and competence to our It is unnecessary to adduce instances of similarity. ples will have weight, that to give employment to who wish to be informed on the subject. an indigent virtuous female, is to remove her from the temptation of vice. We do not suppose that the openly vicious are to be reclaimed, but Continent, and hence the landed interest in Eng- to undersell the Americans, who have not all yet says the Spanish proverb, 'tempts the wicked equal to the burdens borne by the grower of corn twice or three times a day, instead of once a person, but the IDLE person tempts the devil."

It is not for the profit and virtue of the eastern states, where straw plaiting has been most frequent, that we plead, it is for every state, but for our own in particular; in this city, the introduction and encouragement of the manufacture of Britain, in the year ending 5th January 1823, (at grass and straw hats, would be one of the greatest a duty of 10d. per 120) distinguishing the couned-and the neglect of such an attempt to secure the amount of duty received thereon. the benefits of this employment to the industrious indigent females of our city, is a stain upon the fair escutcheon of our reasonable philanthropists.

were relaxing in their restrictions on Commerce. oats, until they reached certain prices at home. Dr. Cooper, in his late pamphlet against the ta-riff, applies a similar remark, particularly to the for the quarter of eight bushels, and when it rose ministry and parliament of England. It is some- to that, the ports were to be opened for foreign what singular, that a man who has been so often wheat, upon a duty being paid. Some of their before the public of England and the United political economists have contended for the un-States as a controversial writer, should risk such restrained freedom of the corn trade: but every a position, and thus furnish his opponents with an attempt made by them in Parliament to effect argument against the cause he defends.

So far from the assertion of Dr., Cooper being 26th of February, 1823, Mr. Whitmore moved true, that not only the ministry, and parliament, for leave to bring in a bill only to amend the corn but private men a . I societies are unceasingly upon laws, and was powerfully supported by the late the look out for occasions to alter the existing Mr. Ricardo, a man of the greatest weight in the duties upon foreign articles, which can in the house on such subjects, but they could not sucleast possible way affect the home industry of ceed .- The object was to lower the present limits their fellow subjects. They seldom require an at which the exportation of grain could take existing duty lowered, but often ask to have it place, from 70s. to 60s. and to repeal the duty increased, or for a new one to be imposed on an upon its importation. Ministers and the farmers article, before free.—The Board of Trade are do not wish the subject legislated upon, for fear particularly charged with this important and of the movement ending in giving encouragement truly patriotic duty, and they attend to it with a to the free introduction of foreign grain at low dangers, to which we have alluded. We shall make ourselves understood by our eastern readers, when we say, that the manufacturers of straw hats are now compelled to supply the defect of a broken window, by the remnants of the wardrobe which their former industry purchased; this is an argument with those who remember something of the country habit of New England, of counting a man's wealth by the pains of glass in his house, and calculating his poverty, by the number of that kind of substitutes to which we have alluded.

Treasury, who cannot have time to attend to it with a zeal and vigilance, that do them the highest homour. No sooner do they find out an article requiring an increase of duty, than a law is brought their adherents in partiament and at public dinners, in favour "of the great principles of commercial freedom": and against "restrictions," and about "reciprocity in trade," &c. &c. and we states ought to have such a board, in place of the country habit of New England, of Counting a man's wealth by the pains of glass in his house, and calculating his poverty, by the number of that kind of substitutes to which we have alluded.

Treasury, who cannot have time to attend to it. The united of their actions contradict their professions, we must expose their insincerity. The expression is not very dignified to say that the British are enformer full extent: none of the claim to the free introduction of foreign grain at low to the free introduction of foreign grain at low to the free introduction of foreign grain at low to the free introduction of foreign grain at low to the free introduction of foreign grain at low to the free introduction of foreign grain at low the find the who to the prices; and yet in the face of such uniform conduct, we hear of fine speeches from ministers and duct, we hear of fine speeches from ministers and their duct, we hear of fine speeches from ministers and their actions of fine speeches from ministers and their duct, we hear of fine speeches from ministers and their actions of th mination to pursue their restrictive system to the not very dignified to say that the British are enformer full extent; none of the old duties are deavouring by such language, to throw snuff intaken off, but many additions are made, and that to the eyes of the people of the rest of the world. the exertions of the head of the family, were sufficient to give, not merely support, but ease from any thing brought to England, that no-plies so forcibly that it could not be withheld. The Merchants of Salem and Dr. Cooper, are articles not particularly mentioned, shall pay a willing to believe the British sincere on the subof all was it found necessary for females to resort to any immediate means of adding to the family revenue. The times have changed, and the fathers of families which are not stocked with wealth, look, without any diminution of respectability, to their daughter's industry, for a content tribution towards that fund from which her maintenance is drawn; no means more eligible, none tenance is drawn; no means more eligible tenance is drawn; no means more eligibl 83 7, on plat not made up, and even a duty of to herself in the business of manufactures. The suited to their habits and system, can be found five per cent. ad valorem, upon imported straw? greater cheapness of labour and living, and their than the braiding of straw; and we trust that if To talk of our relaxing commercial restrictions wider field for agriculture, enables the people of the continent to undersell the British; they are therefore prevented from bringing grain to Engfemales, that fashion will for once exercise its conduct in other European powers, to prove what land, antil she is all-but starving. England by arbitrary law, in favour of virtue and industry— is here asserted, as Mr. Carey has quoted several her greater experience, comparative cheapness of yes, it is the cause of VIRTUE. Yes, we repeat of them in his numerous and useful publications, manufacturing labour, arising from the use of it, and we hope it will reach those whose examto which I refer all those who doubt the fact, or machinery, low wages, and the poor diet of the workmen, and above all, from the inferior East India cotton used, and the flimsy textures of the stuffs made from it, and from wool,* are enabled we do believe, nay, we assert, that vice may be land, after the late war, were clamorous to par-prevented by encouraging industry. 'The devil,' liament for a protecting duty on foreign grain, stuffs from good cotton; and eat butter and meat; in England. Accordingly an act was passed to week, or once a month, in place of a daily diet of water porridge, sowens, flummery, or potatoes; and although American workmen are contented with very small profits, yet the great imof the number of foreign eggs imported into Great portance of the command of cash to the British manufacturer, induces him to sell his goods in America for what he can obtain. Hence the acts of public beneficence that could be perform- tries from which the same were imported, with manufacturers in the United States, require the same protection in the way of duties, to enable 240 them to compete with Britain, that England does 120 for her agriculture against the cheaper cultiva-

^{*} To make up for the actually flimsy texture of the cotton and wootlen cloths, made in England for sales at auctions in the United States, they are thickened with flour of wheat, and starch. The cotton fabrics go to pieces after a few washings.

KEEPING COWS.

130. Harvesting and preserving the Swedes.— When they are ready to take up, the tops must bout off, if not cut off before, and also the roots;

in England.

a change in sentiment, and to see the day when fit to keep a cow, but unfit to keep a cat. The wardomestic industry will be duly protected. It is mer the shed is the better it is. The floor should furze, or fern; and to get straw you must give a not for the United States to set the example of slope, but not too much. There are stones, of some part of your dung from the cow-stall and pig-this commercial freedom, about which the people sort or other, every where, and about six wheel-stye. The best way to preserve manure, is to of England talk. Let the governments of Eu barrow-fulls will have the shed, a thing to be by have a pit of sufficient dimensions close behind rope take off their restrictions, and we will do the same: but absolute ruin would attend the unlimited entry of foreign goods without duty, nor give her food in; and she should be fed three can we be said to be upon fair footing with them as respects protection to manufactures, until our sun-set. It is not absolutely necessary that a cow and street in the same is the shed and pig-stye, for the run from these tixed up at the head of the cow is the thing to go into, and from which all runs of rain-water should be kept. Into this pit would go the empty of the shed and of the stye, and the produce of all sweepings and cleanings round the sun-set. It is not absolutely necessary that a cow workmen are enabled to keep out certain foreign ever quit her shed, except just at calving time, house; and thus a large mass of manure would goods. A nation without a tariff, would have no or when taken to the bull. In the former case soon grow together. Much too large a quantity more chance of existence, among the nations of the time is, nine times out of ten, known to with the world, than a bank would have of preserving in forty-eight hours. Any enclosed field or place, of wheat or rye straw is all that you would want its solvency, that redeemed its bills with gold or will do for her during a day or two; and, for such for the winter, and half a one for the summer; silver, while all other banks in the same city or purpose, if there be not room at home, no man and you would have more than enough dung to

133. Now, as to the quantity of labour that the cultivation of the land will demand in a year. portional force to a nation, the domestic industry of which is only partially protected, or to a bank paying part in cash. The prosperity of both will be restrained in a direct ratio to the unequal footing in which they are placed, with respect to other nations and banks. This is an aphorism in political economy supported by the experience of ages.

A Friend to Agriculture, Commerce and Minufactures.

Turn her out upon, to have her led by a string, cultivation of the land will demand in a year.—

We will suppose the whole to have five complete diggings, and say nothing about the little matters of sowing and planting and horing and harvest-ome of sowing and planting and horing and harvest-ing, a smaller quantity of ground will suffice for the keeping of her. Active two or three times a week, which may be done to we will suppose the whole to have five complete diggings, and say nothing about the little matters of sowing and planting and horing and harvest-ing the owner to be an able labouring man; and say impose the whole to have five complete diggings, and say nothing about the little matters of sowing and planting and horing and harvest-ing the owner to be an able labouring man; and say impose the whole to have five complete diggings, and say nothing about the little matters of sowing and planting and horing and harvest-ing the owner to be an able labouring man; and say impose the whole to have five complete.

We will suppose the whole to have five complete diggings, and say nothing about the little matters of sowing and planting and horing and harvest-ing the sides of roads and lanes. Where there is a common, she will, of course, be turned out in the day time, except in very wet or severe weather; and, in a case like this, a smaller quantity of ground will suffice for the keeping of her. Active five course, the will suppose the whole to have five complete. let" of bad hay is, in such cases, the winter pro-vision for the cow. It can scarcely be called food; of the long days of spring and summer, while it and, the consequence is, the cow is both dry and is light long before six in the morning and long lousy nearly half the year; instead of being dry after six at night. What is it, then! Is it not betonly about fifteen days before calving, and being ter than time spent in the ale house, or in creepsleek and lusty at the end of the winter, to which ing about after a miserable hare? Frequently, a warm lodging greatly contributes. For, ob- and most frequently, there will be a boy, if not 129. I have now, in the conclusion of this artitle, to speak of the manner of harvesting and treserving the Swedes; of the place to keep the town in; of the manure for the land; and of the chances of the weather, she will not, though as a hint) I saw, on the 7th of November, a very firetty woman, in the village of Hannington in Willshire, digging a piece of ground and planting the were lodged in house; and in wet weather, she are manure for the following the manure for the land; and of the chances of the weather, she will not, though as a hint) I saw, on the 7th of November, a very firetty woman, in the village of Hannington in two woman, in the village of Hannington in the work in the chances of the weather, she will not vive the same in quantity and will not vive will not yield half so much. It is not so much the cold as the wet that is injurious to all our stock treading the digged ground in that state, she had her line extended, and put in the rows as she adbu neither tops nor roots should be cut off very be provided by collections made on the road; by while she performed the act of planting, which bull in the house, or shed. Put the rest into the results of the residence in a cottage. Let any she did with great nimbleness and precision—ten shel heaps. Make the heap upon the grown in a round form, and let it rise up to a pake and scrape and sweep all into a heap; and done. Her clothes were neat, clean, and tight point. Lay over it a little litter, straw, or dead he will find, that he has a great deal. Earth of about her. She had turned her handkerchief point Lay over it a little litter, straw, or dead he will find, that he has a great deal. Earth of about her. She had turned her handkerchief grass, bout three inches thick; and then earth almost any sort that has long lain on the surface down from her neck, which, with the glow that upon to about six inches thick. Then cut a and has been trodden on is a species of manure.—the work had brought into her cheeks, formed an thin rot green turf about eighteen inches over, Every act that tends to neatness round a dwelling object which I do not say would have made me thin rog green turf about eighteen inches over, and put upon the crown of the heap to prevent the early nom being washed off. Thus these heaps whemain till wanted for use. When given to cow, it will be best to mash the spring, of the remaining heaps, and expose them to them to the and wind; and cover them again slightly with the work like of some sort.

131. As to belace to keep the cow in, much works of the best of manure. Thus goes on the work of the best of manure. Thus goes on the cottage, and not a see in a town or village street; when you have got the count, the the land of ground, the cottage is a real cottage, and not a see in a town or village street; mamely, that the land of ground, the cottage is a real cottage, and by the side of a lit be observed, that, after a time, it will be mine-life to the land of the side of a lit be observed, that, after a time, it will be mine-life to make the land of ground. And, let mannely, that the land wind generally happen; day morning in particular, all over the country, which were formerly the chief food of a great the Wen, there be three square miles actually at something or other, or they are engaged in part of mankind, we should recollect, that those covered with market gardens, that is the full expursuits a good deal less religious than that of fruits grew in countries that had a sun to ripen tent. How, then, could the Wen be supplied, if

the last cabbage is cut. But, after all, the produce a dissolution of society, and give us an observation or two to those persons, who live could be gotten rid of, if the main part were yt a heriming afresh.

all cases. The cottage may be on the side of a ceedingly regret." I have, I dare say, witnessed forest or common; it may be on the side of a lane or great road distant from town or village; it may be on the skirts of one of these latter: and, then, even a large family with garden vegetables? The crop on the ground than they settle in the minds are the family may be faw or great in number. again, the family may be few or great in number, market gardeners round the metropolis of this what is to follow it. They clear as the go in the children small or big: according to all which wenheaded country; round this wen of all wens; taking off a crop, and, as they clear the lig and circumstances the extent and application of the round this prodigious and monstrous collection of plant. The ground is never without see in it or cow-food and also the application of the produce will naturally be regulated. Under some circumstances half the above crop may be enough; especially where good commons are at hand.—

Sometimes it may be the best way to sell the calf sometimes are accepted at th as soon as calved; at others, to fat it; and, at all but a fraction, nineteen thousand acres of gar-another as much as he will for him. But, if I others, if you cannot sell it, which sometimes den ground. We have only to cast our eyes over were situated as one of the person that I have

digging and planting. So that, as to the 200 hours, the fruits and to put nutritious matter into them. it required ten rods to each family? To be sure, they are easily found, without the loss of any of the time required for constant daily labour.

The fruits and to put nutritious matter into them. it required ten rods to each family? To be sure, but, as to milk, England yields to no country upon potatoes, carrots and turnips, and especially the the time required for constant daily labour. 134. And, what a produce is that of a cow! I suppose only an average of 5 quarts of milk a day. In the tis not wholesome in its nature; nothing that is not wholly innoxious. Out of a pail they are for the use of the persons I am speaking If made into butter it will be equal every week to that has ever had grease in it they will not drink of; for a gentleman thinks no more of raising a 2 days of the man's wages, besides the value of a drop, though they be raging with thirst. Their large quantity of these things in his garden than the skim milk; and this can hardly be of less very breath is fragrance. And how, then, is it he thinks of raising wheat there. How is it, then, value than another day's wages. What a thing, possible, that unwholesomeness should distil from that it requires half an acre, or 80 rods, in a prithen, is this cow, if she earn half as much as the then, is this cow, if she earn half as much as the man! I am greatly under-rating her produce; but I wish to put all the advantages at the lowest. To be sure, there is work for the wife, or daughters, to milk and make butter. But, the former is done at the two ends of the day, and the latter only about once in the week. And, whatever these may subtract from the labours of the field, which all country women ought to be engaged in whenever they conveniently can; whatever the cares created by the cow may subtract from these is amply compensated for by the education that is not a found to a family? I have shown, in the last to appear the week and, whatever the tains any thing essentially unwholesome is montanted in the cares created by the cow may subtract from these is amply compensated for by the education that is not a family in a year? Nay, allow that tains any thing essentially unwholesome is montanted to food of a more stimulating nature; when only a ton goes to a family in a year, it is more is amply compensated for by the education that is amply compensated for by the education that these cares will give to the children. They will that been resolved to eat ragouts at dinner and than six pounds weight a day; and what a sort of these cares will give to the children. They will drink wine, and to swallow a "devil" and a glass all learn to milk, and the girls to make butter.—And, which is a thing of the very first importance, they will all learn, from their infancy, to set a just value upon dumb animals, and will grow up in the habit of treating them with gentleness, and the most ample experience, milk is what it, then first the most ample experience, milk is what is it, then they do with the eighty rods and feeding them with care. To those who have and feeding them with care. To those who have not "heavy," and much less is it unwholesome, of ground in a private garden? Why, in the first and feeding them with care. To those who have not "heavy," and much less is it unwholesome, of ground in a private garden? Why, in the first not been brought up in the midst of rural affairs, when he who uses it rises early, never swallows place, they have one crop where they ought to the importance of this part of education. I should be very loath to entrust the care of my horses, cattle, sheep or pigs to any one, whose father never had cow or pig of his own. It is a general complaint that servants, and especially farm-servants, are not so good as they used to be. How should they? They were formerly the sons and daughters of small farmers: they are now the less is it unwholesome, of ground in a private garden? Why, in the first when he who uses it rises early, never swallows, place, they have one crop where they ought to have three. Then they do not half till the ground. Then they grow things that are not wanted.—
To those who have when he who uses it rises early, never swallows, place, they have one crop where they ought to have three. Then they do not half till the ground. Then they grow things that are not wanted.—
To those who have it rises early, never swallows, place, they have one crop where they ought to have three. Then they do not half till the ground. Then they grow things that are not wanted.—
To the who uses it rises early, never swallows, place, they have one crop where they ought to have three. Then they do not half till the ground. Then they grow things that are not wanted.—
To the who uses it rises early, never swallows, place, they have one crop where they do not half till the ground. Then they do not have three. Then they do not have they ought to have three. Then they do not have three. Then they do not have they ought to have they are not one carrier in the search of summer and they ought to have they are not or place. They have they have they have they are not or place. They have they have they ought to have they ought to have they are not or place. They have they ought to have three. The daughters of small farmers; they are now the property-less labourers.—
They have never seen an animal in which they had any interest. They are careless by habit.—
This monstrous evil has arisen from causes which bowl of cold milk, I regard as a pest; and for this whole of the piece of ground remain undug, tilly and they had any interest. They are careless by habit.—
This monstrous evil has arisen from causes which bowl of cold milk, I regard as a pest; and for this whole of the piece of ground remain undug, tilly the first many treatments of the later and the parent who does not do does not do does not do denot this sort, with lettuces all bearing seed.—
Seed enough for half a county. They cut a cabbage here and a cabbage there, and so let the bowl of cold milk, I regard as a pest; and for this whole of the piece of ground remain undug, tilly

a beginning afresh.

in the vicinity of towns, or in towns, and who, thrown away. The rubbish heap always receives though they have large gardens, have "no land four-fifths even of the eatable part of the to keep a cow," a circumstance which they "ex-duce. others, if you cannot sell it, which sometimes happens, to knock it on the head as soon as calved; for, where there is a family of small children, the price of a calf at two months old cannot be equal to the half of the value of the 2 months milk. It is pure weakness to call it "a pity."—
It is a much greater pity to see hungry children crying for the milk that a calf is sucking to no useful purpose; and as to the cow and the calf, the one must lose her young and the other its life after all, and the respite only makes an addition to the sufferings of both.

at out a fraction, nameter thousand acree of general to cast our eyes over when there is not a fourth spoken of in paragraph 137; this to say, if I have den ground. We have only to cast our eyes over what there is not a fourth spoken of in paragraph 137; this to say, if I have den ground. A square mile contains, leaving of that quantity. A square mile contains, leaving of that quantity. A square mile cortains, leaving aground, I would, out of that gard, draw a sufficiency of vegetables for my filly, and would in the Wen's market gardens? The very question is absurd. The whole of the market gardens from Brompton to Hammersmith, extending to Battersea. It has a calf is sucking to make it yield enough for a confidence of the was my make it yield enough for a confidence of the was my make it yield enough for a confidence of the was my make it yield enough for a confidence of the was m

to the sufferings of both.

136. As to the pretended unwholesomeness in certain cases; as to its not being adapted to some constitutions, I do not believe one word of the matter. When we talk of the fruits, indeed, on both sides of the Thames, to the eastward of or ground! I have kn many men dig 30 rods

fourteen, digged 20 rods in a day for more than temptible. ten days successively; and I have heard of, and believe the fact, of a man, at Portsea, who digged 40 rods in one single day, between day-light and sun-set. So that it is no slavish toil that I am here recommending.

FROM THE NEW YORK EVENING POST.

ON THE INSECTS WHICH INJURE PLUMS AND CHERRIES.

New-York, June 17th, 1824.

N. GOODSETT, Esq.

Sir-When you brought me a few days ago, by an insect, I gave perfect attention to the dis-one of the twelve new and until then, undelineat-them opened and the kernels saved, during the course you made, and the demonstration which ed kinds, contained in the Entomological manual long winter evenings, or in wet weather, whereby accompanied it. You gave me the most conclu- of insects, (fasciculus 1) published in 1797, in he could find himself well recompensed for all sive evidence that the skin of the young fruit Latin at Nuremberg, by my late correspondent, his expended trouble. was divided by a sort of semi-circular incision, the distinguished Godfried Christian Reich, Proor scratch; that within or beneath it, an egg or fessor at Erlangen, &c. nit was deposited; and that when the hatching process had gone far enough, there was a worm assured of my thankfulness and regard or larvæ, which had eaten its way to the surface of the stone, or woody box containing the kernel. Thus, there was proof enough that the integuments had been penetrated; the rudiment of the destroyer inserted; and in several of the specimens, the grub or caterpillar, was actually devouring the pulp.

As soon as I expressed a desire to know what the harent-insect or "Imago" was, you produced and heavy, and very foolishly pronounce a libel the creature, which you assured me had laid the on the blood, which is quite innocent, while we fection, the cultivator should make choice of one egg, shy-retiring and difficult to catch; but, which, never suspect the damp atmosphere of robbing for seed while growing on the vine; dry the seed you had nevertheless, by your perseverance suc- us of our electricity. Yet so it is. In dry weather, in the shade, and sow them in a rich soil, early in ceeded in seizing and securing on a tree at Har-

It is a subject of infinite regret that this ness, and even suicide itself, no expense ought to in plantations where there are many young negroes,"

COMMUNICATION.

To the Agricultural Society of South Carolina, forwarded for publication by the Chairman of the Committee on Publications.

The last year, (1823) I selected two half acres of land, of a light sandy soil, as equal in quality as possible, with the view of ascertaining the most profitable mode of cultivating the Sweet Potato-namely, whether the seed ought to be cut into two or more parts, according to the usual practice, or to be planted whole. These two half acres were manured equally with long litter or straw from the barn yard, and the same labor was bestowed on each. The result is as follows—the half acre planted with the cut seed produced 56½ heaped bushels, being equal to 113 bushels to the acre, and gave no vines in time* for slip planting. The half acre planted with the whole seed, gave 108 bushels, being equal to 216 bushels to the acre, and produced vines early and in abundance. As the experience of one year, however, cannot lead to just conclusions in agriculture, I shall continue the experiment until I am perfectly satisfied as to the result.

rotting Dover,

I might have been excused, had I mentioned as a fact of some personal interest to yourself, that about 10 miles below West-Point, we passed "Stoney-Point," memorable in history, from its having been so gallantly stormed during the revolution by a detachment from the American army, commanded by Gen. Wayne. I need not remind you that your uncle, Capt. afterwards Col. John of bold and beautiful features; from the loftiest stuard, or Jack Stuard, as he was familiarly called, specimens of rude sublimity, to the softest scenes of phere not much below it, we lost no time in set-

feet as he actually entered the fort. set out for the top of the mountain, 13 miles distant from the Village, in company with the four English gentlemen, before mentioned, who are making a tour of our country, Mr. and Mrs. H. and Mrs. and Mrs. S. of your city. The first ten Catsberg or Catskill Mountain. The house, erect-

might be gratified with a nearer view of an Insti- you meet with him under perfect subjection, is at present badly kept, by a man either ignowhere you might expect to encounter him in a rant of, or above his business, the too common contest for the mastery of his native haunts, that fault of American inn-keepers, who forget the you are just going to penetrate. The road winds, nature and duties of their adopted station, and as the ground admits, along the side of the mounth the truth of the maxim, that "keep thy shop and as the ground admits, along the side of the mountain, in serpentine form, through vines and forest the shop will keep thee."

trees, of great variety and beauty, admitting no We returned the same afternoon to the Village, where of a view of the Hudson Valley below you, and embarked the next morning at 10 o'clock on tain the practicability, the route, and probable ex-pense of Roads and Canals, by means of which spread magnificence from the front of the hotel on reached Albany at 3 o'clock, P. M. The stagethe products of the most distant points, are made the summit of the mountain, where a flat table rock fare from the Village to the top of the mountain virtually to approximate the best markets; at the about 200 yards square, has been spread out by the and back is two dollars. same time that they serve as links of great chains hand of nature, as it were for the very purpose of to bind the States in union, indissoluble. The supporting an observatory, whence the eye takes recent addition to the studies of this Institution, in at a glance a portion of five States. The margin and Albany—a list of them may be interesting of Mineralogy and Chemistry, as applicable to the of the rock immediately in front of the Tavern to the traveller :overjets the ground for some hundred feet below formation on these subjects too, which cannot fail it. The view from this precipice, to those who venture to approach the brink of it, reminds one

" And dizzy 'tis to cast one's eyes so low!

"The crows and choughs that wing the midway air,
"Shew scarce so gross as beetles:"

And the site of the "Catskill-house" itself corresponds yet more exactly, I might say, almost to a fraction, with that of the Convent of Laverna, as described by Barry Cornwall, in his Marcian Colonna-

"Chasms of the early world are yawning there,
"And rocks are seen, eraggy and vast and bare;
"And many a dizzy precipice sublime,
"And caverns dark as death, where the wild air

Rushes from all the quarters of the sky:

Above, in all his old regality,

The monarch Eagle sits upon his throne,
Or floats upon the desert winds, alone.

"There, betted round and round,
"Black pine, and giant beech, and oak that rear
"Their brown diminished heads like shrubs between,

"And guarded by a river that is seen
"Flashing and wandering through the dell below,
Laverna stands."

So stands this Mountain Hotel on a bare solid rock, in the gloomy recess of the darkest forest, several miles distant from any human habitation, of those sciences to all the domestic and valuable at an elevation of 3000 feet above the Hudson, which winds its way under your eye for 70 miles and value of the Erie Canal; you were answer-through the cultivated Valley below!!! It would ed with an edifying commentary upon Governor be utterly impossible for me to give you a just idea Yates' proclamation, a patriotic descant on the of the extent and variegated beauty of the land-rights of the people, and the practical difference scape seen from this spot. It far exceeded my anticipation after all I had heard, and it may be doubted whether any country can boast of one so doubted whether any country can boast of one so vast in extent, together with such a combination ed atmosphere of a city where the political mer-

seat" coach, and over an excellent turnpike, we for the depth to which it tumbles, and the wild work in the way of the traveller, as if to give

OBSERVATIONS OF A CORRESPONDENT, on a visit to saratoga,—#0. Iv.

Dated, Saratoga Springs, 6th Aug. 1824.

In my last I gave you a brief sketch of the origin, rise, progress, condition, and great publick utility, of the MILITARY ACADEMY at West-Point. I did so in the hope that your readers Point. I did so in the hope that your readers.

I miles passes you over a handsome undulating and improveable farming country, when you begin feet front and three stories high, with very extensive accommodations and a piazza that affords step, having been first refreshed at the foot of it, some by a drop of the "blue ruin," and others coording to the design of the company who own by paying "THREE CENTS FOR A SIGHT AT A BEAR," which you do the more cheerfully, since establishment, intended to be 180 feet front. It is at present badly kept, by a man either igno-

Arriving at Albany on the Saturday preceding the extraordinary session of the legislature, we found the town crammed full, even to overflowing; so great was the concourse of legislators, editors of newspapers, politicians of all grades and fac-tions, and strangers of every State and country; that it was difficult to find a resting place, even for a single night. If the occasion for calling the legislature was extraordinary, the excitement produced by it was no less so. Did you speak to a citizen, or a fellow sojourner at the Tavern, of objects naturally presented to the mind by the local associations, such as the genius and ability of CLINTON for devising publick works and institutions of general utility; the unostentatious munificence and efficient personal agency of Van Ransellear in promoting such objects; did you advert to the splendour of Hudson scenery, or the extent Stuard, or Jack Stuard, as he was familiarly called, and after whom you take, I suppose, the name of John Stuard; participated actively in the dangers of that brilliant achievement, in consideration whereof, and of other services, Gen. Washington delivered to his representatives after his death, an honorary medal, which had been struck for your uncle by order of Congress, with emblematic devices; one of which represented him with bare feet as he actually entered the fort.

Stuard, or Jack Stuard, as he was familiarly called, and after whom you take, I suppose, the name of civilization, and the most splendid exhibitions of art; for where in all her works does art exhibit any thing more majestic and impressive than the sight which you enjoy from the portico of this mansion in the clouds, of numerous steam-boats wending their rapid way in defiance of winds and the Aqueduct, before we turned to the wides, and carrying on their bosom thousands of Mohawk, would, of itself, be regarded as an object worthy of a visit by all travellers, and would excite greater admiration were it not involuntative. excite grea er admiration were it not involunta-Leaving West-Point at 5, P. M. we landed at midnight, at Catskill Village; and, at our leaving after breakfast, the next day, in a fine "Springfor the depth to midnight to

ED. AM. FAR.

[FROM THE ST. AUGUSTINE'S PAPER, OF JULY 3.]

The Committee of the Agricultural Society to whom was assigned the duty of reporting upon the agricultural capabilities and prospects of the territory, beg leave to submit the following sum-mary which contains all the information they subjects referred to them :-

In taking a view of the agricultural capacities

forests of the west.

I persuade myself that your readers will be perature maximum of summer heat 92° in the gratified with the condensed view of these great shade and the greatest change 8° in 24 hours. A

* Among the plants common to both are the man-

orange trees of 20 years standing were killed in especially, are much indebted for the collection New-Orleans, Pensacola, and Georgia in the se-and lucid exposition of so many valuable facts to vere frost of February, 1823, the groves of St. Augustine and on St. Johns only lost their leaves and produced fruit the same year.

With respect to our diseases, the remitting fever may be considered as the principal cause of the mortality in the N. E. section of Florida. The month of May is generally dry and pleasant, with cool and refreshing sea breezes, occasionally interrupted, however, by S. W. and N. W. winds. In June the rainy season is expected to commence, and so continue until July, during which time the [For the following interesting sketch of East S. W. winds, which may be considered the most Florida we are indebted to Mons. Achille Murat, insalubrious wind that blows in this section of the a worthy nephew of Napoleon the Great, who country, prevails for 16 hours out of 24. A long described. This report, condensed as it is, pre-thing which comes within its influence to become ever, in extraordinary seasons, and even when It is but 14 years since commissioners were first appointed to explore the grounds between tions, in which it is affirmed, that the growth and who are much exposed to the meridian sun, and

Before entering upon the interesting subject of the soils of the territory, we would observe that a mistake has hitherto prevailed respecting the geological character of Florida, it having been considered by Cleveland and others as consisting of alluvial deposit; while, by the recent investigations of Mr. Pearce, whose contributions to geological science are sufficient evidences of his competency to decide upon the subject; it appears that the general basis of the country is of secondary limestone; a fact of much importance, both as regards agriculture and other sources of are enabled to collect for the present upon the prosperity, for in a region of this formation not only may a productive surface be expected, but beds of minerals and metals may also be supposphur and chalybeate, which are found in differ-

ent parts of the country.

East Florida, if considered as bounded on the west by the river Apalachicola, comprises an arena of about 30 millions of acres of land and water, and deducting therefrom 1-3d for water, leaves 20 millions of acres of land of various descriptions. The largest class of these consists of pine lands of various descriptions—the next di-vision of high and low hammock—the third of swamps, and the fourth of savannas and fresh marshes along the margins of the rivers.

Of the pine lands the soil is composed chiefly of silicious sand, with some admixture of yegeta-ble mould resting either on marl or clay. Those of the best quality are characterised by the occur-rence of red oak and hickory intermixed with the prevailing growth of pine, and with an excel-

lent pasturage of natural grass below.

The next description which prevails to a great extent is characterised by a growth of the long and short leaved pine, with an undergrowth of the grasses, whortleberries, gall berries and other shrubbery, and near the sea by the saw palmetto. prickly pear, &c.

The first and second qualities of pine land have sional extreme in drought or gales. suppression of the practice of burning which has hitherto been so prevalent in aid of hunting and grazing, both the timber and soil throughout the Rice, since the time of the British coloniel gonists, but was neglected under the

We cannot conclude this cursory view of the country without noticing the advantages it possesses in point of pasturage. The raising of cattle and horses, was conducted with great success, both by the Indians and white inhabitants, previous to the recent troubles of the province; the cattle raised in the savannas were so remarkably fine, that Gen. Jackson when in the country had a selected portion of them conveyed to Tennessee, to improve the stock on his farm, in that state

Fertility of soil is not, as we all know, the only source of agricultural prosperity: manuring and good husbandry are also essential, and for the former we possess the materials in the utmost abundance; and much of the labour of ordinary husbandry would be lightened, by the loose and friable nature of our soils.

Our facilities for water transportation, are not surpassed in any part of the United States, and an intercommunication by means of canals may be easily effected through every part of the country. A survey has been ordered by the general government, of the country between the Suwaney and St. Mary's, with the view of opening a canal between the heads of these rivers, through the Ockefenoke swamp, the distance not being more than 18 or 20 miles. This would shorten and facilitate the communication between the western and Atlantic States, and would not fail to produce great collateral benefit to Florida. Were the course of the canal directed from the Suwaney, through Black creek into the St. Johns, the ex pense of the work would be much lessened, and the route between the Atlantic and the west not materially lengthened. The St. Johns, running parallel, nearly its whole course with the Atlantic, may at different points be connected by short canals, with the ocean; while it might easily be made to communicate with the gulf on the west, by the streams which run in that direction, and head near it.

The necessarily succinct view of the climate, soil and productions of Florida, will serve to evince, that it is not from the want of natural resource and advantages, that it has not advanced in prosperity, as rapidly as the other territories that have been added to the Union.

205 THE CULTIVATION OF THE VINE.

We take pleasure in the belief, that those of our correspondents who have written in relation to the Vine, and the adaptation of our soil and climate to its growth, and the importance of the subject as a matter of comfort and economy, have succeeded in awakening the public attention to this very interesting object.-Enquiries begin now to be made of us, where cuttings are to be had, and how they are to be treated .- In answer to these we have the same answer to make which has been given on various occasions-To wit-That we put in the FARMER, all we gather on every subject to which it is devoted.—The previous volumes of this journal abound in essays and instructions on the topick in question; still every day is de-veloping something new, and it is our pleasure to collect whatever may be new and useful.-In regard to the practicability of obtaining cuttings, it has been made known that Major Adlum of Georgetown, (D. C.) has them for sale in great variety at the proper season, and if there be others who can supply them, we shall be glad to proclaim it.—We have no doubt the time is coming when the demand for good grape

cuttings will be very extensive, and the very low price of all the ordinary staple commodities admonishes the farmer to cast about for other and more profitable objects on which to bestow his care and labour.—The culture of the vine is easy, simple, not laborious, and ever amusing. Every farmer might without one dollar of additional expenditure, at least supply his table abundantly with this delicious and wholesome fruit .- The tending of the vines in the garden should be one of the favourite amusements of

himself and his family .- To those who may be disposed to give it the attention which it merits, the following instructions for planting and pruning, which we derive from the Winchester Republican, will be acceptable and useful.-We invite for this article the attention and criticism of those who, from experience can judge of its correctness.—We shall very soon give a list of the names and character of the most approved grapes cultivated in Europe-such as yield us

"The Claret smooth,
The mellow tasted Burgundy, and quick,
As the wit it gives, the gay Champaigne."

Edit. Am. Far.

TREATMENT OF GRAPE VINES.

Previous to his leaving Winchester last Fall, Mr. Togno left with the editor of the Winchester Republican, the following directions for the treatment of the vines he had planted in the neighbourhood. Owing to inattention, their publication has been deferred longer than was expected; although not too long to answer the purpose intended.

The way to plant the vines.

Select good healthy shoots of last year's growth in the month of January, and put them by in a dry cellar. Let the cuttings be of six eyes, and cut from a fruitful vine as close to the growth of the year before last as possible. In a fine day of February or March, make holes two feet by two and a half deep; lay the cuttings in them and fill them up with fine garden mould. Do not put manure in them, as it will cause them to rot; hoe them well through the season, and keep them free from weeds.

Figure 1, represents a young vine in the fall of the first year after planting, the whole of the cutting having been covered, with the exception of one bud at O, which has put forth the shoot OM. The way to prune the vine the first year is to cut off AQ at A, and to lop off the shoot

at B.

Figure 2, (first year). If the cutting should be too long, and by some accident or other there should be more shoots than one, (as in fig 2.) then prune the whole of AD at the point A, and afterwards lop off the top of the shoot MM at B.

N. B. Where there are more shoots than one, you will select the healthiest and do as above. Never leave more than one shoot, nor to the shoot more than one or two buds in the first year, nor more than two or three in the second year. Never let shoots grow on the body of the vine or from the root. The time of pruning the vines in Virginia should be a fine day in February or March, but no later. You must be very careful to use always a sharp knife, and to hold the stock firm in the left hand, below where you want to cut, and to pull your knife upwards. The first and second years cover the vine stock with straw during the winter,

The vine we have pruned in fig. 1 or 2, will, in the fall of the second year, be much such a vine as figure 3. In pruning it, you will top off CL at Q, and CN at D, so that CD will be the last year's growth, on which will be three buds, which will shoot three branches, as in figure 4, and this will be the view of the same vine in the fall of the third year. Then prune SR at S, and lop off the two other branches at M and B, leaving three buds of the last year's growth on each of the branches. The next fall you will have excellent grapes, sweet and well flavoured, which will ripen more regularly and a great deal faster than if not treated in this manner. The vine will never be killed by the cold of the winter, and the young shoot in the spring is less apt to be injured by the frost.

TO THE EDITOR OF THE AMERICAN FARMER.

ON GUINEA GRASS, SEA KALE, AND AN IMPROVED PLOUGH.

Near Selina, (Ala.) 28th June, 1824.

DEAR SIR-Of the several parcels of Guinea Grass seeds which you gave me last winter I plant ed some of that which had been received from Ja maica, and divided the others among my friends. Not a single seed of that which I planted vege tated, and I have only heard that one of those with whom I divided, has succeeded in obtaining plants. I planted at the same time, some of the seed which was raised the last year, in South Carolina, with which I was equally unfortunate. With the Sea Kale I have succeeded better, as many of the seed, though planted in March, came up. The plants are growing vigorously, and present a very rich appearance. I am much pleased with the hope that it will prove a most valuable

acquisition to our early Spring vegetables.

The plough which I promised to give you a description of, is called the Jumping Shovel, for the quality it possesses of jumping over any root or other obstruction with which it meets, some distance below the surface, and immediately passing on without breaking the continuity of its furrow, and without hanging, to the great annoyance of the ploughman, and injury to the team. It also saves much time which is consumed in new land, in extricating other ploughs from innumerable objects of resistance under the surface of the ground. The construction of this plough is extremely simple, and I really think it, from experience, the best plough that has everyet been used for the preparation of new land, projecting point, as is usual with coulters. The coulter should not touch the point of the shovel, but should be from half an inch to an inch before tit, and the point of the coulter should go about half an inch below the point of the shovel. The coulter should incline but very little forward sylvanic when the plough is in motion, but should be nearly perpendicular. I think a coulter of a lancet shape, below the beam, runs the best, but my ploughmen prefer one shaped thus:

To prevent the coulter from splitting the beam, with further facts. an iron ring, fitting it one way, and so long the other way, as to allow the upper end of the coulture, with a wedge before it, to fasten it, to pass through the mortice and through the ring, leaving the ring, above the beam before the coulter, will be an objection to not would choose itself;" ibid: "an objection of Adams' Philosophy, will be provided the power of attracting the lightning a few feet out of the direction it would choose itself;" ibid: "an objection of Adams' Philosophy, will be provided the power of attracting the lightning a few feet out of the direction it would choose itself;" ibid: "an objection of Adams' Philosophy, will find this sentiment "a pointed conductor has not even the power of attracting the lightning a few feet out of the direction it would choose itself;" ibid: "an objection of Adams' Philosophy, will find this sentiment "a pointed conductor has not even the power of attracting the lightning a few feet out of the direction it would choose itself;" ibid: "an objection of Adams' Philosophy, will find this sentiment "a pointed conductor has not even the power of attracting the ring, above the beam before the coulter, with a pointed conductor has not even the power of attracting the lightning a few feet out of the direction it would choose itself;" ibid: "an objection of Adams' Philosophy, will find this sentiment "a pointed conductor has not even the power of attracting the lightning a few feet out of the direction of Adams' Philosophy, will find this sentiment "a pointed conductor has not even the power of attracting the lightning a few feet out of the direction it will be provided the power of attracting the lightning a few feet out of the direction it will be provided the power of attracting the lightning and the power of attracting the lightning and the power of attracting the lightning a few feet out of the direction it will be provided the power of attracting the lightning and the power of attracting the lightning and the power of attracting the lightning and the power of att plough, much diminished.

-00 On the Manufacture of Straw and Grass Bonnets .- No. 6.

At the request of the writer, Mr. BAYLIES has furnished him with a sketch of his remarks, in the House of Representatives, in favour of the increase of duty proposed on Leghorn hats. They are highly interesting, quite to the point, and furnish materials for melancholy reflection, upon the indifference exhibited by our Representatives, to the source of wealth which the manufacture to

which they refer, opens to the United States.

A Friend to Agriculture, Commerce and
Manufactures.

Remarks of Mr. BAYLIES of Massachusetts, on his motion to amend the Tariff, by striking out the minimum duty of one dollar on Leghorn Flats and Hats, and inserting three dot-

I am aware that by altering the minimum price on which the cost of this article is to be estimated, from one dollar to three, a high duty in pro-

It has been assumed as a principle in the course of the debate on this bill (the Tariff) that a protecting duty ought to be given in such manner, and to such an amount, as shall enable the domesyet been used for the preparation of new land, from any other cause, has diffused it, or a portic manufacturer to compete on equal terms with shovel plough, with a coulter before it, without a showledge, with a coulter before it, without a ling objects?

This principle will not apply to my motion. It is This principle will not apply to my motion. It is If such a case, were the usual precaution of my design, I admit, to exclude these flats and glass bottle necks, or other repellents placed in hats from our own market, and that exclusion is the staple rings, which connect the rod to the to be wished, by all who are friends to domestic economy, as well as domestic industry.

During the year ending September 1822, the sylvania, has thrown such doubts upon this sub-amount of the cost of Leghorn hats and flats, as estimated for the purpose of ascertaining the

During the last year the Treasury estimate is

If the importation of the fabrics of Leghorn was prohibited, trade would not be injured. do not exchange our commodities for Leghorn bonnets and hats, but the proceeds of half the American trade in the Mediterranean, are invested in these straws, which otherwise would have been invested in articles more necessary.

less costly, and paying more freight.

But my object Mr. Chairman, is to protect, to constructed, whenever the point of the coulter pointed or knobbed) may also be drawn from the encourage, and to renew a branch of a domestic

Some twenty-two or twenty-three years since, on without loss of time, without any jerking to too much consequence; for it is now well known, a young lady either of Franklin or Wrentham in the ploughman or team, and without breaking that points have no influence at all, unless they Massachusetts, was induced merely for the purpose of experiment, to undertake the fabrication of a bonnet from straw. Her experiment succeeded, and in consequence of her success some "Hence it is evident that the effect of conductors of the females who lived in her vicinity, were alin general is too inconsiderable either to lessen so induced to try the experiment, and they also succeeded .- In that neighbourhood the business South Carolina, but much used in some parts of So dissonant are these sentiments from the soon became general. If on the other hand, the importation is prevented, you will restore and revive a branch of manufacturing induswith this high duty, continue to wear the foreign fabric, the revenue will be benefitted, and the nation will gain something, by taking a folly which cannot be prevented. If on the other

WORMS IN THE HEAD OF SHEEP.

TO THE EDITOR OF THE AMERICAN FARMER Washington, Aug. 27, 1824.

Dear Sir :- During the last winter and spring, some of my neighbours lost a number of valuable Sheep by worms in the head. In some cases as manufacture was in its most flourishing state, a was told on good authority, that the annual amount of the sales of straw bonnets manufactured in ten adjoining Towns, (townships) in Massachusetts, was \$500,000. The whole amount has been stated by the chairman of the committee the sales of them. I have some of them in my possession, preserved in spirits. The largest are over half an inches the sales of the circular from some gentlemen of respectability to the common cut worm, often so destructive to who are well acquainted with the subject, states our cabbage plants. They are encircled by ten the amount to have been in some years \$1,500,000. These straws were woven and shaped by head, which is black. As they increase in size fences were reared, his decaying house was repaired; taste came in with her embellishments, and neatness and plenty literally united around the hut of poverty. Sad indeed is the reverse Cold and cheerless want once more revisits the nuansions of the poor.

The Considered fine introduced on extination of the poor.

Nowever, attogether conjecture, I observe that daubing the sheeps nose with tar is considered as ram 78, F. Moore; 27, ewe, 56, J. Barrett; 28, ram, a protection against this unknown enemy. What the hut of poverty. Sad indeed is the reverse this opinion. I have always made the strengthen this opinion. I have always made to strengthen this opinion. I nansions of the poor.

The Caprice of fashion has introduced an article manufactured from the straw of Tuscany, which, to say the least, has deprived numerous excepted) we have to contend with. My present American families of many of their comforts. The tulip-mania of Holland was not so ruinous to that nation, as the mania for wearing Leghorns is to this. The vast amount which was formerly paid to our own citizens, which gladdened the poor man's heart, which increased the poor man's heart, which increased the mountain. At present prices, with us, productiveness of our soil, and relieved our citizens from debt, is given to the Tuscans! Fashion has said that it is ungenteeft oappear in a domestic bonnet:—a word has ruined a manufacture which subsisted thousands!

Sumptuary laws are not justifiable; could they be justified in any case, they would be in this.

Should the motion now before us prevail I think it will go far towards the exclusion of the coarser, and least valuable fabrics of Leghorn; and if our country women choose to pay \$50 or the four words and if our country women choose to pay \$50 or the four words are of how were a few to the sheep owners in this country, sleep owners, as 5, cross; 37, ram, 30, Cens. Summer; 38, ewe, 50, I. P. Dana; 40, ewe, 57½, I. P. the spirit of enquiry that now prevails, that some useful facts may be elicited. Should this be the case, you may expect to hear from me again.

I am, Sir, very sincerely, yours, &c.

the extent of this business, that I did not believe try which cannot injure the nation, and which the consolation, however, of having got up, in fine order, extraordinary crops of wheat, rye, oats and hay.

WOOL-SAXONY SHEEP.

[The Editor on a late visit to Saratoga Springs, was presented by General Sumner, one of the purchasers of the Saxony sheep, with a sample of the wool, which may be seen by any far-mer or manufacturer. The object in copying into the Farmer the following article, is to shew that fine wooled sheep are coming again into the public esteem; and also to shew, for future use and reference, into whose hands these sheep have passed. In the names of several besides General Sumner and Mr Hurlbut, we recognise some of the most enlightened and publick spirited practical agriculturists. here repeat our request that subscribers in the seaports, and proprietors of manufactories would furnish us with the present prices of wool and with remarks upon the wool market, which appears to us to be very precarious and without stability or system] .- Edit. Am. Far.

FROM THE CONCORD (N. H.) REGISTER.

Report of the sale of Saxony Sheep, by Messrs, coolidge, Poor & Head, at Roxbury, (Mass.) on the 15th July, 1824.

The average price was \$69 35.

By the above account of sales of Saxony sheep. it appears now certain, that there are a respectable number of gentlemen who are inclined to encourage the importation, and growth at home, ine

TO THE EDITOR OF THE AMERICAN FARMER.

MILLET-ON NEW LAND.

Palmyra, August 8, 1824.

DEAR SIR:-I have seen several accounts of crops of millet in your paper, which appear to be smaller than one I raised last year. Four quarts were sown on what was intended to be an acre, but by measurement since it appears to be 190 rods. The produce, when threshed, was measured and turned out fifty bushels. The land was part of a piece I cleared for wheat. The wood had been partly cut off for firewood, and the burn was in consequence not so good as on the rest of the piece; large spots were left on it unburnt, so that we thought it would not answer well for wheat. If you are acquainted with clearing land you will know, that the crop is considered to depend, in a great measure, upon the goodness of the Corn Crop.—We have intentionally wait-the burn. The drought last summer was the ed for some weeks before we would undertake to greatest ever recollected in this State. The land announce the calamity that is impending over the on which the millet was sown is a loam, in a slight agricultural interest of the Eastern Shore—The degree more moist than the remainder. The destruction occasioned by the drought is univerwheat adjoining was the best on the piece; we sal, and we lament to say that accounts from all supposed it to be a little more than twenty bush-quarters assure us, that the crop is now too far els to an acre. The millet was sown the 7th of gone to be benefitted by rain, and that the quantiappear to be very fond of it. Four quarts of seed year. The destruction is unexampled and almost to an acre, is the usual allowance here; which be ad calculation.—Easton Gaz. seems to be much less than your correspondents at the south use. My men judged that the straw made a ton and a half of fodder, and the cattle ified to judge, who took a ride last week through eat it as readily as good hay.

I would recommend to beginners at farming in particular, to begin on wild land. The business is much the most simple, requires no knowledge of the minutiz that must be attended to on old farms; there is much less danger of failure of at Baltimore about the 25th of the present month. crops; and it is, I believe, the most profitable.
Yours, &c.
H. WARREN.

Editorial Correspondence.

ing, which seems to be general; but before this time we have not had a general rain since the evening of the 3d of June last, although there has been frequent showers, in some settlements there has been nearly a sufficiency; in others there has been nearly a sufficiency; in others there has been one or two good rains since the 3d of June; seed Oil, 65 cents.—Clover Seed, out of season—Linseed Oil, 65 cents.—Clover Seed, out of season the consequence of such partial showers is, that -Flax Seed, rough, 75 cents per bushel-Timoin some settlements nearly common good crops thy, Do. out of season—Hay, per ton, \$10—Flax, will be made, in other settlements not more than half crops, and in others not more than half crops, and in others not more than a third of the usual crops will be made. Calcu-7 cts. to 14 cts.—Lad, 10 cts.—Bacon, 6 a 7 cts. lating from my observations and information, I presume there will not be more than half the 35 cts.-New Wool, 30 to 35 cts.-Merino full State; there is, however, a considerable quantity 25 to 28 cts.—Common, 20 to 25 cts.—25 per of the last year's crop of corn now on hand, which cent. more when well washed on the sheep and of the last year's crop of corn now on hand, which the free from tags.

will afford much relief; and, I presume, with the free from tags.

MARYLAND TOBACCO.—Fine, yellow, none in market, wanted—good do. 20 to 30, scarce—fine market, wanted—good do. 6 to 10 do.—common of corn for ordinary consumption until the next red, 12 to 18 do .- good do 6 to 10 do .- common crop. The prospect of the cotton crop is unpro- dark, 2 to 4 plenty, no demand. mising; I am not prepared to calculate very nicely the influence which the rain now falling may have on the growing crop. The consequence of the partial showers of rain has had, in some dehave on the growing crop. The consequence of the partial showers of rain has had, in some degree, the same influence on the cotton as on the corn crops. I think the calculation is a fair one to estimate, that the number of pounds that may be made on each acro cultivated in this State, 12 1-2d per lb.

ERBOR CORRECTED.—In the 22d Number, under the head Observations of a Correspondent at Saratoga Springs, where an account is given of the Military Academy at West-Point, it should have been stated, that no Cadets are admitted under the head observations of a Correspondent at Saratoga Springs, where the partial showers of rain has had, in some degree, the same influence on the cotton as on the corn crops. I think the calculation is a fair one to estimate, that the number of pounds that may be made on each acro cultivated in this State, 12 1-2d per lb.

will not bear a greater proportion than five does to eight, when compared with an average crop of cotton made last year on each acre cultivated; although the quantity of land cultivated in cotton this year having been increased since the last .-I presume the calculation would be reasonable to estimate, from present prospects, that the quantity made in this State the last year was 20 to 30,000 bales more than will be made this year.'

Yours, respectfully, &c. IRBY HUDSON, Treasurer Putnam Agricultural Society.

ELLICOTT-STREET, PRATT-STREET-WHARF, HEAD OF THE BASIN,

Offers for sale, red and saplin CLOVER SEED, of TIMOTHY and ORCHARD GRASS SEED, of this year's growth, and HERDS GRASS SEED, all of a superior quality.

And, an extensive assortment of GARDEN SEEDS, most of which were imported last spring, or raised at his farm. The imported seeds have been proved to be true and vegetate well.

Also, BIRD SEEDS, such as Canary, Rape,

and Hemp Seed.

In store, as usual,
A general assortment of IMPLEMENTS OF
HUSBANDRY of the most approved patterns, workmanship and materials; among which are a number of the much approved CORN SHELL-ERS, all of which he offers at reduced prices.

For Sale,

A fine BULL CALF, half Devon, one-fourth Holderness, one-fourth short horn Durham breed. The dam of this calf was got by Bergami out of an imported Holderness of the long horn breed.

Also, a three-fourth Devon, one-fourth Holderness BULL CALF, and several one-half blooded Devon BULL CALVES, out of fine country cows. Enquire of the Editor.

Portable Threshing Machine.

We understand that J. W. CRAGG has made a Portable Threshing Machine, which has been in operation for some weeks, and which he intends to continue moving from farm to farm. The machine is one of four horse power, but capable of being worked by six horses; said to work remarkably easy, and is readily moved from one farm to another by four horses, harnessed as for drawing two carts. He is at present threshing for four cents per bushel. The machine to purchasers, we are informed, would cost \$500.

Copy of General Smith's certificate :-

Baltimore County, Aug. 30.
I employed Mr. J. W. Cragg to thresh out my grain with his machine; and, at his request, now tate, that it got out 139 bushels of oats in one hour and forty-five minutes. The threshing was as clean as it possibly could be.

J. SPEAR SMITH.

Mr. Buel,

Of Albany, avails himself of the medium of the American Farmer, to reply to several gentle-men in Virginia, Maryland, and Delaware, who have sent orders to him for "white flint," seed wheat. A quantity of seed is expected from Cayuga County, the 14th September: the price is \$2 the bushel, exclusive of barrels. It will be shipped to New-York, to be put on board of vessels for Philadelphia, Baltimore, and Alexandria, agreeable to orders, as soon as the purchase money is received, or deposited in the hands of J. S. Skinner, Esq. Editor of the American Farmer.

nes of water in the esponTO THE PRESIDENT OF THE PENNSYLVANIA AGRICULTURAL SOCIETY.

Powelson, Philadelphia County.

Dear Sir :- I have the honour to present, various selections from European works, to establish certain positions, which have been assumed, in son.e of my late communications. In corroboration of the facts, which have been alleged, I produce and Sheep.

I am aware, it has been hinted, that too much discussion, had arisen, on the properties, of Farm his offal enriches the soil. Stock; but I may object, that no subject, is more interesting, and none more important, to the husproduct of their labours, and of their lands. I hemp, and flax, the farinaceous parts, of wheat, buckwheat, and a portion of rye, and indian corn, for whiskey, and bread, nearly the whole, is employed, for the nourishment, of Neat Cattle, Horses, Sheep, and Swine.* Thus without regarding, the immense forests, whence we derive, our principal supplies, of beef and mutton, and I should hope, ere long, we shall receive the greater part of our wool,—I think it is evident, that to our population, at least, it is worth some effort to ascertain, whether experience, has established, in the country, where they are best known, and by the standard, which every man, can best comprehend, the superiority of one race of Neat Cattle, over the services of th

race, more generally into view.

The Editor of the American Farmer is requested to inform his ingenious and ardent correspon- "second calf has not been dry since she dropped dent "A Subscriber" that in New England, and "her first, having given four quarts on the morn-Pennsylvania, when the measurement of milk is "ing of her second calving." given, it is not from a wine quart, half filled with froth, and that when an animal is produced, sought the stock, of those breeders, who have (whether Devon, or Short Horn) as of a definite race, some evidence is required, to show, that it is the propensity to become fat. race, some evidence is required, to show, that it is the proposition, and the not an accidental variety, of mongrel origin, stampled with a fushionable name, suited to the purposes agricultural interest, both in Parliament, and his of the vender, or adapted, to the fancy of the county, is generally known, evinces great anxiety, for the dissemination, of this breed. In his expectation, and the county, is generally known, evinces great anxiety, for the dissemination, of this breed. In his expectation, and his breed. In his expectation, a highway. Vol. 6.—25.

No man will deny, the importance, of the ani- Society, after reciting, the origin, of the differ-mal, whose milk, affords butter, cheese, and vari- ent families, of Short Horns, upon his estates, ous combinations for his table-whose hide, gives mentions, those, which "IN UNITING THE TWO leather for machinery, harness, and his shoes-whose hair, supports the plaister upon his wallswhose horn, and bone, are converted into, medicines, and articles constantly in his use-whose tallow, and fat, are consumed in candles, and soap, necessary to his comfort, and health-whose heels, afford oil, valuable, in many of his pursuitsfor publication, part of a letter, which I have just received, from Major Rudd, a gentleman, of high standing in Yorkshire, distinguished alike, by his zeal, and success as an improver, of Neat Cattle, spring, after having enabled him, to reap the harspring, after having enabled him, to reap the harvest from his fields, yields the most wholesome, and nutritious food for his frame, and finally by

It appears by Baily's survey of Durham, that interesting, and none more important, to the hus-bandmen, and landholders, of the eastern, middle, sold for 2,802 pounds 9 shillings sterling—eleven and western States, than that which, indirectly bulls for 2,361 pounds—twenty-eight animals, thus involves, the application of three-fourths of the produced \$22,948 67. That Major Rudd paid, product of their labours, and of their lands. I apprehend, that not more, than one-third, of their cultivated soil, is annually subjected to the plough, that of its produce, except, small quantities of hemp, and flax, the farinaceous parts, of wheat, buckwheat, and a portion of rye, and indian corn, buckwheat, and a portion of rye, and indian corn, and Col. Mellish paid, 450 guineas, for the servi-

the superiority of one race of Neat Cattle, over and support it by their demand, it must be inferskill.

* In the best districts, there will generally be not less than one half of the land employed in raising roots and green crops for live stock, and not more than two thirds of the inferior soils are always under these crops and in pasturage. Probably not more than two fifths of even the arable utmost confidence of their pre-eminence. From land, or ten acres in a hundred of the whole sur
fire traduce crops in mediately applicable to most promising appearance, and greatly excell
NEW-YORK HORTICULTURAL. iand, or ten acres in a hundred of the whole surface, froduce crops immediately applicable to the food of man. The remaining ninety acres, after a small deduction for fresh-water lakes, are appropriated to the breeding, rearing, and fattening of live stock." (Sinclair's General Report of the agricultural state and Political circumstances of Scotland—vol. 3. page 1.)

"my three years old heifers I have calves of the NEW-YORK HORTICULTURAL SOCIETY.

Pursuant to public notice, the anniversary celebration of this institution took place yesterday, at Syke's Commercial Coffee House. The following gentlemen were elected officers for the ensuing year. son she gave eleven quarts at a milking with grass only. A heifer of three years with her second calf has not been dry since she dropped

ESSENTIAL QUALITIES OF MILKING AND FAT-TENING are highly valuable;" and adds' "two "heifers and, a bull, were this Spring, forwarded to Thomas Law, Esquire, at Washington; from " friendship and connexion-as well as the desire, "to support, the credit of my farming the very best specimens, were selected. The steers, which "have been bred, and slaughtered, have been "equal, in quality of beef to any thing I could "have expected or desired. At two and a half years old they weighed from 80 to 85 stones of "14 pounds each, equal to 1120 or 1190 pounds," although reared in the usual mode, upon turnips, chaff, and straw. In mentioning the draught oxen on his farms, Mr. Curwen observes, "those "which are now at the Schoose, were produced "there, and are of the Short Horn breed. Wil-"liam Eve, who has long been with me, and is "accustomed, to the working of both Devon"shire, and Herefordshire cattle, is of opinion, "that the Short Horned, are quite as quick as "the former, and as powerful, as the latter."

I have for some time, bred from the bull, and an heifer, begotten in England by General, Mr.

the superiority of one race of Neat Cattle, over every other, either original or improved.

If it shall appear, that, by the multiplication of this race, "the produce of beef, upon a given extent, of land, would be nearly doubled"—the quantity of butter increased—the facility, of procuring powerful oxen for draught, not lessened—and withal, that the amount of offal, would be diminished—the weight of flesh, and of fat, would be carried upon the proper parts, I trust it will not be contended, that the discussion is futile, or the premium absurd, which shall have brought this race, more generally into view.

and support it by their demand, it must be infered and support it by their demand, it must be infered and support it by their demand, it must be infered. To show the fourteen years, the animal from Mr. Champion, have his highest commendation, and are fitted he declares, for "milking, and fattening." It must be observed, that unless the pedigree, be traced on both sides, the animal mention, the names of some of the most distinct and fattening." It must be observed, that unless the pedigree, be traced on both sides, the animal mention, and are fitted he declares, for "milking, and fattening." It must be observed, that unless the pedigree, be traced on both sides, the animal form the proper parts, it is an important duties of the most distinct and fattening." It must be observed, that unless the pedigree, be traced on both sides, the animal form from Mr. Champion, have his highest commendation of the declares, for "milking, and fattening." It must be observed, that unless the pedigree, be traced on both sides, the animal form from Mr. Champion, have his highest commendation.

To show the interest, which has been claimed. To show the interest, myself were of his "very best blood"-those half bred, his offspring by a native cow would be a quarter bred calf, whose progeny, by a native

Fairbairn, William Wilson, Thomas Hogg, Immediately after the address was pronounced, Board of Agriculture. Stephen Van Rensselaer, James M'Brair, John M'Intire, Charles Oakley, a resolution was introduced by Mr. Lyon, that a the patron of our agriculture and horticulture. Andrew Clark, David S. Lyon, Philip Rhinelan-General Morton.

On announcing the result of the election, and days. in introducing the President elect to the chair, Martin Hoffman, Esq. the late President, addressed the new incumbent as follows:

SIR-I have the pleasure to inform you, that you have been elected President of the New-ting the interests York Horticultural Society. The unanimity of the association. its members on this occasion, in selecting you as their President, cannot be more grateful to your gentlemen, consisting of the members of the So-

unanimity, this society have selected to aid you other parts of the country. The President was rection and aim may prove detrimental to the performance of your duties, its prosperity will be promoted, its patronage increased, and its and bouquets of which adorned the hall and tausefulness extended.

whose zeal for its interest, whose talents and replete with splendid imagery and the true spirit

To this address, the President elect made the deferred till our next. follow reply:

SIR-I accept with grateful emotions, the chair which you have so long and ably filled, and at the same time feel very sensibly the kind manner in which you have conveyed to me the choice honour it. that has been made, and the honour that has Allow me, Sir, to say, and in doing so, to express cultural institutions of this city. the feelings entertained by every member of this association, that while they regret that your avo- Edinburgh. cations have induced you to tender your resignation, as their presiding officer, they will ever

cherish the remembrance of your faithful and important services, and the urbanity with which you have uniformly performed the duties of your office. Accept, Sir, from me, and from every member of the society, our best wishes for your bappiness.

At 3 o'clock, the President delivered an inaugural address, before a numerous audience, consisting of the members of the society, and the distinguished guests who had been invited to participate in the festivities of the anniversary celebration. Too much cannot be said in com-mendation of this able, eloquent, and highly instructive discourse, which was long and elabo-rate, comprising a historical sketch of horticultural science, from the earliest ages to the pre-sent time, with concise notices of its eminent cultivators and patrons; a full exposition of the great objects of the society, to which its future efforts should be directed; and the facilities which are afforded in this city for the cultivation of horticultural science, by means of a fer-tile soil and a widely extended intercourse with all parts of the world. At the close of the address, particular notice was taken of the splendid system of internal improvements in this state, which has opened a pathway into the depths of the western wilderness, bordering upon the shores of the great lakes, where extensive and unexplored fields are yet in reserve for the labours of the naturalist-concluding with a high and merited compliment to the illustrious works, so propitious to a developement of the proud of the day.

By Mr. Colden. Horticulture—the offspring of Agriculture. The parent and child may be proud of the day.

improve our farms so readily and profitably, as by adopting the experience and practice of men who have scientifically and successfully investigated the subject. We have before us, a prize essay of Arthur Young, well known in the agricultural world, delivered to the Bath and West of England Society, on the nature and properties of manures, and the mode of preparing and applying them to various soils, founded on practical experience. We regret that our limits do not permit us to give the whole of this excellent essay; but as it embraces many kinds of manures not yet in-reous earth already in the land; and it is easy embraces many kinds of manures not yet in- reous earth already in the land; and it is easy

It is extremely difficult to discover, from the ticularly the Shannon. knowledge at present possessed by the public, Marles the most common in England are clay marle, stone marle, and shell marle. They are by some distinguished by their colours, white, red, blue, black, &c. but colours deserve no other attention in these bodies than as indicative of iron.

Showledge at present possessed by the public, what ought to be the quantity of calcareous singularly specific le mineralis,) are both the bottom of lakes. No person, whose tention in these bodies than as indicative of iron. Institution, 11 per cent. This is an inquiry, convolution, 12 per cent. This is an inquiry, convolution, 12 per cent. 1. The Nature of Marle.

The Bath and West of England Society is a body much too enlightened to use any term in an advertisement, the purport of which has not been well considered. When, therefore, the expression nature is admitted, as distinct from properties, they seem to require some intelligence on the component parts of the substance used as that many poor soils possess the same or nearly the component parts of the substance used as that many poor soils possess the same or nearly manures; alluding probably by the term here the same proportions, as these most fertile ones. adopted, to the passive qualities of bodies, as To attain the truth in so important a point, inthe active ones are supposed to be discriminated duced me to repeat many trials, and to compare under the word properties.

Whatever benefit may result from exposition to the atmosphere, it must be attained after every circumstance; and I am disposed to con. Marle is a fossil substance, usually composed clude, that the necessity of there being a large spreading; the quantity is too large and carriage of sand, clay, and calcareous earth; the red and proportion of calcareous earth in a soil depends too expensive to permit any additional operations. black marles have a small quantity of iron. I on the deficiency of organic matter; of that or- If dredged from the bottom of lakes or rivers, have analyzed red marle from Cheshire, which ganic matter which is convertible into hydrogen the heaps should be left from six to twelve had seventeen grains in one thousand; and there gas. If the farmer find by experiment, that his months. soil has but a small quantity of organic matter, or which prussiat of potash will not give some note to the presence of that mineral. The quantity worth more than 10s. 15s. or 20s. an acre, he of calcareous earth varies extremely from 25 to may then conclude that there could be the there can be concluded. of calcareous earth varies extremely, from 25 to may then conclude that there ought to be 20 per cent. Mr. Kirwan remarks the impropricent. of calcareous earth in it; but if, on the ety of not calling a body chalk which contains contrary, it abound with organic matter, and be more than 80. One of the best clay marles worth in practice a much larger rent, in that case great for bulky manures, that every means should contained 40 per cent. of calcareous earth, 50 of his marle cart will not be called for, though there be used for lessening it. The most important Marle falls in pure water;—but all examination by water is uncertain, if the water itself be not first analyzed. It falls also by exposition to the atmosphere. Of its three constituent parts, calcareous earth is composed of about one third part carbonic acid, which is driven off by heat. The clay contains generally a small portion of the clay contains generally a small portion of the clay contains generally a small portion of a little volatile alkality and some sulphuric least harmless.

2. The Properties of Marle.

Water dissolves 1-680 parts of its weight of ges of the atmosphere moulder it down; and the calcareous carth; and we find in this 32-100ths roots of the grass combine it with the surface, where it is preserved much longer than if stirred is always all above 1-150ths of its weight of carbonate of lime. I immediately by the tillage of a fallow. This renate of lime) it contains; and to every enlighten. The vegetable acids have a great affinity with mark applies proportionally to the looseness of ed farmer it must be sufficiently evident, that as calcareous earth. In this respect however, the the soil on which it is spread. On sandy soils it all fossil manures are intended to correct or in quantity demanded is very small; for Lord Dun- is essential to good management. But I have in prove the texture of the soil, its constituent parts donald asserts, that all the calcareous earth to my own practice found, by the use of some thoumust be known before any application can ration be obtained from an acre of most crops will not sands of loads, that the above position's strongly exceed 80 pounds. Should the soil be deficient applicable to wet and heavy loams, as well as to in calcareous earth, the application of marle sandy loams, both of which have been greatly

must with this view be important.

In regard to sand and clay, they both enter as

improved by clay marles. Let it be remember- raised by a shaft, has improved from 3s. 6d. to 31s. 6d. an acre.

9. The Soil.

The defect of a soi! must be understood, before a wise farmer will put himself to the ex-pense of marling. The experience of every day will inform him if his land want tenacity and con-lent to braid it as fine as possible, and sells for her solidation; but the want of an addition of calcareous earth, as a food of plants, can be discovered only by analysis. There are other circumstances which demand attention. If the chrysantheum, segetum the polygonum pensylvanicum, and the rumex acetocella abound, the experienced farmer will pronounce that the land wants marling; and turnips producing deformed strings of roots, plain, out of the profit on the hats, for doing the without swelling into the proper gobular form, work for them. They earn from thirty to forty or being extremely subject to the well known sous a day in plating straw, while they can hire a This is soon dispatched; for the business of distemper of the anbury, both afford a similar poor woman from the Appennines, for eight or proof of too much looseness of texture, and sug-gest the consolidation of clay marle. Those hands from being hardened by rustic labour, which teams have leisure for the work. And if these are bought for the purpose, in order to finish a whole farm as fast as possible, that the farmer land is generally a proof of an acid soil; and all may reap the longer benefit, they are generally peat soils are found, on analysis, to contain a Arno, whose beauty and graces have been so kept at work the whole year through; but if the considerable quantity* of the gallic acid, or tan-much celebrated by travellers, whose language business is on a smaller scale, so that the farmer ning principle.† Some have been rendered quite Alfieri went to study, and who seem born to emmay have his choice; on all wet and heavy soils steril by acids.‡ "I was led," says Mr. Wight, bellish the arts, and serve them as models. They it should be summer work, and on dry ones, it to see a stratum of moss impregnated with are the shepherdesses of Arcadia, but it is bevitriolic acid so abundantly, that out of 4 lbs of cause they are not peasants, resembling them only the moss one pound of green vitriol was extracting their health and freedom of care, and knowing This is an object of extreme importance; for I have known very ill effects from giving over dosuphat of iron abounds in a degree almost equal-ses of marle, and in some cases the fact is curious. It is supplied to the finest event and their fatigues. I have been assured that a less of marle, and in some cases the fact is curious. In the earlier stages of the improvement in Norone of the finest watered meadows in England,

7 Translated by Dr. Rigby, London, 1819.

This manufacture is become a source of prosperity to the valley of Arno; it brings an annual return of three millions (of francs) which are divided among the females of the country, for the men have no concern in this branch of industry, lent to braid it as fine as possible, and sells for her own profit, the hats she has made; the money which she thus earns, at length, forming her dower.

The father of a family, however, claims of the females of his house some of the labour on his farm; this is done by the women from the mountains, who are paid by the younger women in the

Such are the female peasants of the vale of

enriching the nation, by their labour

The following extract from a late English paper, shows what has been done in consequence of Cobbett's publications on the Leghorn hat business. The people of the United States will be able to collect some useful hints from his remarks, although a few of them do not apply to our situation; but they could not well be omitted.

FROM COBBETT'S REGISTER.

The farther I inquire and observe, the more complete is my conviction, that the Italians seldom or never make use of the straw of grass; and I am of opinion that we ourselves shall rival and beat straw of grain. I have now numerous specimens of Italian plat before me; some very coarse, and some very fine, though by no means so fine as the plat of Miss Woodhouse. Very fine, however, and I am convinced that even this fine is made out of the straw of grain, though to obtain straw sufficiently fine for the purpose, great pains must

The way to obtain the straw was to sow wheat or rye at the rate of about fifteen bushels to the acre. Miss Woodhouse chose to make use of grass in order to surpass the Italians in the fineness of her work, and she has surpassed them; but the straw of grain would be gotten much easier than that of grass, for a prodigious quantity would stand upon an acre of land; it would be all of one ros-

crested dog's tail, and one from the maiden's hair putting the plat together. The Leghorn is what to knit the plat and how to make it in the proper grass. None of them are exquisitely fine; but is called knitted together; and this is a very nice manner. grass. None of them are exquisitely fine; but number seven is most beautiful. I have compared it with a piece of Leghorn, which is nearly of the same fineness; and in every respect the Norfolk production is the best. These specimens contain six instances of joining or knitting together; and the doing of this has, it seems, been discovered by the lady who made the plat. Better judges than I am, pronounce this knitting to be less. The edges of the plat must consist of 13 straws, neither more nor judges than I am, pronounce this knitting to be less. The edges of the plat must be so constructions and from those of forcign nations too, the means of good living to those who are now miserably fed and miserably clad. If some Irish Lord were, perfectly well done. It is with great difficulty led as for the eyes, or loops, or slips, as they are perfectly well done. It is with great difficulty ed as for the eyes, or loops, or slips, as they are to set about the introducing this into Ireland, what that the eye can trace the joining; and therefore, we need be in no apprehension as to an incapacity along to knit the two pieces of plat together. In cheaper than the Irish could. However, I exto perform this part of the work.

A gentleman from Suffolk has sent me some spe-

he finds in getting the platters to work upon the new plat will, I imagine, very soon disappear.— made, I do no People are always unwilling to consider that it is essential. which they have been accustomed to do, as being they have not been accustomed to do. But a short Jews and Jewesses of London. time gets the better of this sort of feeling, and However, already has there such will be the result in the present instance,—
I look upon the discovery as of the greatest importance, as leading to the habit of domestic man-

Probably enough straw to make five thousand bonnets might be grown upon an acre of land. It should be cut just when the milk is coming into the grain of the head ears of the field. In most the grain of the head cars of the head. In most fields, and especially in the woodland countries, you will find places under big trees and along the furrows where the straw is very small, and where the ears are scarcely an inch long, and have no grain, or only a single grain, in each of them, and that an imperfect one. In the 'Cottage Economy' I mentioned the different sorts of wheat, and projected out those which I thought best for this. The bonnet man in this town has received them.

London for a bonnet than she would of sending to London for butter or milk. It is a thing perfectly matchless in its facilities. The materials are to be found as easily as the dirt we tread upon. It is not necessary to be possessed of a single farthing in order to acquire them, in a certain extent, at an imperfect one. In the 'Cottage Economy' expend ten pounds a year in straw hats and bonnet than she would of sending to London for butter or milk. It is a thing perfectly matchless in its facilities. The materials are to be found as easily as the dirt we tread upon. It is not necessary to be possessed of a single farthing in order to acquire them, in a certain extent, at an imperfect one. If they are in the contraction is a project of their calamities to middle men. The middle men take away that which ought to remunerate be found as easily as the dirt we tread upon. It is not necessary to be possessed of a single farthing in order to acquire them, in a certain extent, at a certain extent, at the contraction of the contraction of the matchless in its facilities. The matchless in its facilities. The matchless in its facilities are to be found as easily as the dirt we tread upon. It is not necessary to be possessed of a single farthing in order to acquire them, in a certain extent, at a certain extent and the contraction of the pointed out those which I thought best for this The bonnet man in this town has received them purpose; but I am satisfied that any sort will do.

The grass of various sorts may, nevertheless, be used; and I can see no reason why the great had the:n built, after having bought the plat of a has been used, which we are to look upon as the variety of sizes and of colours, afforded by the plat merchant, who has first bought it of the number that will be used. Gentlemen who are grass should not prove advantageous, rather than platters, in the platting district. Here, then, are ashamed to put the poor miserable things of comotherwise. Certain it is that we have all the mathree persons between the platter and the wearer. mon straw upon their heads, will be delighted terials here; and certain it is also that I have, at These three persons must each of them have a with a hat made of materials such as I find in the this moment, platters at work upon English Rye greater profit than the platter. Now, is not this this moment, platters at work upon English Rye straw who are producing work equal to any that I can find that has come from Leghorn. This is coming to the point; and the point will have been come to in a very short time; for it will not take more than a fortnight to turn this plat into bonnets. I prefer beginning upon the grain straw, because it is the very same material that the Floorentines make use of. Several sorts of grass will make much finer and much more beautiful plat; but it will not be the same as that which comes

order to secure this point, care must be taken, pect I must confess, much more to be done by the when a fresh straw is put in, to give it so much of cimens of plat made by his daughter and his maid the fastening, before its turn comes to be on the To them we must leave the undertaking. I hear, servant. These are very good, and his specimens edge, as to make it secure against the force of the and indeed I know the fact, that the importers are of grass are very good also. The difficulty which needle. Whether this can be learned without now selling Leghorn bonnets at a loss. But what seeing and examining a piece of plat properly will the benefit be if we prevent the sending of made, I do not know; but learned it must be, for half a million of money out of the country? To

This work of knitting has been considered as a of less value and less importance than that which sort of mystery, retained to themselves by the Nevertheless, I cannot help thus early observing

However, already has there been an inroad made upon the mystery. I understand that sevewhere the article is used. At present, the persons who plat straw live in particular districts, and follow the platting as a sort of trade. This following the straw live in particular districts, and follow the platting as a sort of trade. This following the straw live in particular districts, and following the straw live in particular districts. low the platting as a sort of trade. This, to a to sew. It is right that those who possess the ta ON THE CULTURE OF THE HAUTBOY certain extent, and for exportation, perhaps may lent should be paid for the communicating it to be desirable still; but what I want to see is this, others; and they will be paid for it, of course; the hats and bonnets made in people's houses afbut it cannot long remain a thing not as common ter just the same manner that shirts, cravats, and ly known and as easily performed, and more easisuch things are made. Before, when we had no ly too, than the making of a collar of a shirt. Be idea that we had the material to make them of, it always understood, that, as far as my wishes go,

kind, and would be free from weeds, and from all turally congregated together, and became the un-derworkers of the master manufacturers or dea-thing being confined to particular districts, that I London for a bonnet than she would of sending to existence as to prevent a poor creature from cut-ting a bundle of grass in his hedge; and what

eight specimens sent up by W. B. from Norfolk. but it will not be the same as that which comes from Leghorn. It will be better, but not the same; and samongst strangers, and giving about seven of the same as that which the straw of grain, and which does, indeed, make very beautiful plat.

The eight pieces of plat sent me by W. B. from Norfolk, exhibit a most admirable specimen of the same by W. B. from Norfolk, exhibit a most admirable specimen of the same as that which comes pounds amongst strangers, and giving about seven are brought to that country by the export of the several articles made of straw. We are told that the Italians work cheap: but I am quite satisfied, ficulties are, they must be overcome; and I will now endeavour to remove some of them. The soon work them out of this species of traffic. If attention, industry, and skill. Five are, I see, great difference between a Leghorn that and an I lived in the platting districts, I would have perfrom the common Bennet grass; two from the English one consists of the different manner of sons brought thither to teach the young girls how

STRAWBERRY.

TO THE EDITOR OF THE AMERICAN FARMER.

A few weeks past I sent you some observations and reflections on agricultural subjects, made duror where to get straw to split, it was necessary to go to the farmer and make a purchase; when this was the case, the hat and bonnet makers nawhich our wives, daughters and servants are in Cacil County. It was there, at Rose-hill, the

and its innocent pleasures, from which circumstances had so long withdrawn me, was at once to yourself agentleman on the wrong side of sixty, who will not allow you to call him old, and whose in revolutionary anecdotes, contemplating with conscious pride, in all our institutions, the fruits of the independence which he contributed to establish; his venerable person overshadowed, protected, and nourished by his own vine and his to come, as enduring monuments of his taste and providence; and, when you have done this, you will be ready to make one of the party of friends which I am authorised by a carte blanche to take with me on my next visit to this patriot of '76, who possesses that peculiar art which the French expressively call the "savoir vivre."

Amongst numerous proofs of skill and success in his horticultural operations, I noticed, particularly, his flourishing beds of Hautboy Strawberries, which are gathered in their proper season, not this fine fruit have failed, I took the opportunity to obtain from him minute directions for its manngement, which he has since reduced to writing with a distinctness which cannot fail to impart valuable instruction to your readers. You are aware that the scarlet and the Hautboy Strawberry are natives of America, and were taken hence to England about two centuries ago. The varieties of this, like other fruits, have been so multiplied by cultivation, that it has become, even with the aid of the pencil and all its colours, almost impossible to represent them. The enlightened President of the Horticultural Society, T. A. Knight, Esq. has himself not less than four one stroke cutting under your hand. This done, keep all clean by good cultivation; straw in time hundred varieties—but as there is no time to be carefully clean your beds from all grass and weeds, for fear of injuring the bloom; plant one male and lost I submit to your readers the following:-

Directions for the culture of the Hautboy Strawberry, as practised at Rose-hill, in Cacil County, Maryland.

"The plot of Hautboy Strawberries, to which you refer, is 87 by 40 feet, planted about the year 1802, is in perfect vigour, although most probably not one of the original plants remain.

ches apart, the alleys three feet wide, though to the plants, but you prevent their being injured notes of the when the beds are dressed and in neat order, the by water lying on them; the edges of your beds alleys shew but 18 inches, 9 inches being taken should be neatly patted with the spade, and the from each side to dress the beds. I prefer a flat alleys made even and smooth with the rake. As and rich loam, whether red or yellow immaterial, soon as your beds are somewhat settled, and when so that it is rich, neither too retentive of water, severe frost is about to set in, carefully cover them nor too quickly becoming dry. When you commence making a plantation, the ground should be seed; be not sparing of this article, which should

beautiful estate of Gen. F. where I saw so many having thus marked off each end of your beds, amination, you will find a growing bud under the insignia of good taste, such numerous sources of proceed to the sides, and as before directed, first rational enjoyment, and abundant means of real stretch your line, and place a stick at every 18 dressing of the beds, carefully spread on some vacomfort, that my early passion for country life, inches, for the whole length of your beds on both sides. You will understand that you have but three rows of plants in each bed, to the middle renewed and invigorated. If you would realise row of which you can reach from the alleys with-the enviable lot of my old friend, you must figure out treading on the bed, which never should be permitted. Your 12 foot stick is now to be converted into a marking stick, commencing at the active personal habits and sprightly conversation sides or 18 inch sticks, begin at the top or first seem to forbid that you should; blessed with a sticks of the opposite sides, by drawing very tight ry part of your beds and alleys, to a depth sufficient to perfectly cover the earth, and it answers own fig tree, and his estate beautified by the clm, a similar scribe throughout your whole plot if you with more ease.

the sycamore, the walnut, the maple, &c. planted by his own hand, and destined to survive for ages best for you to prepare small sticks of cedar or until they are done fruiting, but as soon as the if you place a small stick of some durable wood should be attentive to keep down the runners and at every male plant, that in case of failure you weeds before the bloom commences, and be made by quarts, but bushels. dollars each, which must be paid in advance. dollars each, which must be paid in advance.

Roxbury, July 12, 1824.

Duke o'Limbs.

A fine young BULL, two years old last February, is offered for sale. His sire is the celebrated Teeswater bull Bergami. His dam, a beautiful heifer, is by a Teeswater bull, out of a fine cow of the Lancashire broad horn bread. His grand dam and dam took the first premium at the Cattle Show, in 1820, at New-York, as the property of Mr. Warren De Lancy, they being adjudged the best milch cow and calf, amongst a great number on the ground.

The Duke is of a deep red colour, with a few white spots about his eyes; he is large, remarkably handsome and docile. Lowest cash price, at the farm of the proprietor, near Rockville, Maryland, 150 dollars. If delivered in Baltimore or Washington, ten dollars additional will be expected. It is confidently believed by the proprietor, that, considering his blood, size, fine points, good temper, and youth, few more desirable animals, of his race, are to be found in the United States at any price. Apply to the Editor of the Farmer.

No. V. 8th August, 1824.

Amongst the great variety of visiters who have recourse to this place, some for health and some for pleasure; young men in search of wives, and wives to shew off their daughters; not the least numerous or valuable class consists of sedate and intelligent Parmers; chiefly those who migrate hither annually to escape the diseases of the Southern climate. These soon get tired of the Southern climate. These soon get tired of the continual round of lighter amusements, provided for the entertainment of the young and the gay, and readily embrace every proposal to reconnoitre the adjacent country. Hence we found yesterday, no difficulty in making up a party of a dozen farmers from Georgia, South-Carolina, Massachusetts, Pennsylvania, &c. to beat up the quarters of Earl Stimson. Esq. residing fifteen miles from of Earl Stimson, Esq. residing fifteen miles from here, in the town of Galway; well known for having taken in 1819 the premium offered by the Agricultural Society for the best cultivated farm in the county—an honour dearer to the heart of that ever shadowed the brows of Alexander or Cæsar.

We were received very politely by Mr. Stimson; to whom it was obvious such visits were by no means uncommon. He seemed at once to understand our object; and having first tendered us refreshments, promptly offered to conduct us over the farm—so away we followed close at his elbow. It was a miniature picture of Mr. Coke, and his 500 followers over the fields of Holkham, except that we went on foot, and Mr. Stimson himself was not mounted on an old white charger, with sagacity to conduct his master's guests through the most fertile portions of the fields, as was, I suppose, jocularly said of the great Norfolk farmer by one of his friends.

We examined as minutely as the time would permit, his various crops; the implements and processes by which they were made; and every where we saw exemplified the great desideratum of judicious farming, to wit: Labour judiciously applied as to time, and manner, on fields in good condition, yielding heavy crops.

You may feel assured that with a dezen close at

his heels, some connoisseurs, and some amateurs,

our host was well employed to answer all the interrogatories we put to him-no student, on trial for his degrees, ever encountered more critical examination, and few are ever so well prepared to pass the ordeal; and here let me premise, that Mr. Stimson is a plain matter of fact man, who proceeds on the solid foundation of experience, with habits of close and accurate observation; wedded to no theories which practice does not sanction, and always ready to be guided by re-

sults, even though he can not trace them to their causes. Hence when he announced to us in the outset, that his plough never sunk beyond the depth of three inches, was always drawn by one Produce, 50 bushels to the acre, horse, and that his manure was always given to his small grain crops, and spread upon the surface, to be turned in only with a light harrow—we, farmers by the new lights, were all astonished, and with one voice demanded his justification for this heretical departure, from the newly es tablished canons of the church-agricultural! He replied, gentlemen, I pretend not to be deeply versed in the rationale, of farming; my business is with its results. I can only tell you, that in tilling my land, at best a laborious business, my sole

object is clear profit-I have tried all the systems I have heard of, and can only say, that the one I follow is the one which most improves my land, and yields me the greatest nett income from la Ploughing both ways one furrow bour and capital! This was a kind of argumentum in a row, without disturbing the

system of farming, which it was supposed had been as an old criminal, tried, condemned, and executed, beyond the power of respectively. Premium Farm-its management and produce. galvanic battery, reanimated and put in motion a

of 250 acres of arable land; whereof a considerable portion, of course, is in pasture, and 100 acres of wood. He was reaping his principal crops when we were there, and judging from appearances, compared with past years, he calculates on gathering 150 tons of hay, 2,000 bushels of potatoes, 5,000 bushels of grain of all sorts, and 10,000 weight of pork.

As late as the year 1812, the average crops of

The grand and America, would intercourse the Medican and the constant in the constant in the constant in the constant in the constanti

Nashville, (Tennessee) Aug. 27th, 1824.

Two varieties of this troublesome and destructive race are found principally to infest the territory of the United States. The small black rat, which is probably a native of the country, and the tawny or ash-coloured rat which has been imported from Europe. The former is seven or eight inches long without the tail, which is eight inches more. The belly is of an sh colour, and the back of an iron grey, bordertowns on the frontier, and for two or three hundred miles west of tide water. Thus far they have exterminated the native rat, and hold their territory by right of conquest. They are also to be found in Nashville, Louisville, and Cincinnati, but we are not therefore to suppose that they have achieved the conquest of all the intermediate on the prairies. It is a social animal, and es, and the banks of rivers, ponds and ditchently upbe open fields. It subsists indifferently upbe open fields. It subsists

carrying any other mode into operation, would be to the last degree inconsiderable. This plan let it be observed, embraces the construction of side cuts and locks of the most approved kind, should there be any situations in which the tow boats cannot be advantageously employed, and also contemplates the navigation of steam boats of an easy draft. The latter measure must be highly beneficial to the stockholders and to the community at large.

The proposed plan has had a fair trial, in the presence of a number of respectable citizens, and has received the approbation of two of the most distinguished engineers of our country.

To the above let us add that the whole of the

miles, 120,000 dollars. Perhaps there has scarcely ever occurred a case in which so much solid advanage was attainable on such easy terms.

Should this plan succeed, as by proper management, we have no doubt it will, the stock cannot fail to be highly profitable—but the profit on the stock, whatever it may be, is a trivial object, compared with the numerous and important advantages it will insure to the capital of the success of the slain.—But the Levantine rat besides being much stronger and better able to desides being much stronger and better able to desides being much stronger and unpalateable that the cannot fail to be highly profitable—but the profit of ject, compared with the numerous and important advantages it will insure to the capital of the slain.—But the Levantine rat besides being much stronger and better able to desides being much stronger and better able to deside being much stronger and substitute and the being much stronger and better able to deside being much stronger and substitute and the being much stronger and better able to deside being much stronger and substitute and trouble of the slain.—But the Levantine rat be-able to deside The large ash-coloured rat (called by Mr. Buffon, the Surmalot) is in length about nine inches, its eyes large and black, and the colour of the lad and upper part of the body of a light brown of the obstructions to the navigation of that river.

MATHEW CAREY, CHANDLER PRICE, WILLIAM DUNCAN, ISAIAH LUKENS, BENJAMIN TILGHMAN.

Philadelphia, August 28, 1824.

The large ash-coloured rat (called by Mr. Buffon, the Surmalot) is in length about nine inches, its eyes large and black, and the colour of the lad and upper part of the body of a light brown or ash-colour. The end of the nose, the throat and belly, are of a dirty white, inclining to grey; the legs more sparingly covered with hair than those of the black rat, and of a dirty white, the tail as long as the body, and covered with minute dusky scales, mixed with a few hairs. It differs from the black rat in being larger, more fierce, and stronger as well of a lighter colour. It resembles the wastlenge quantities of grain, and damages the poultry yards, sucks the eggs, and commits more havock among the chickens than the Mink or Fox. And the cracks and fissures which abound dusky scales, mixed with a few hairs. It differs from the black rat in being larger, more fierce, and stronger as well of a lighter colour. It resembles the beaver also, more nearly in its habits and instincts, as well as in its capacity for travelling by water. They have been known to cross rivers by water. They have been known to cross rivers weasel and rat are nearly equal, but their weaby swimming, and to emigrate from one neigh- pons are different. The rat, furnished with four

sheathed, and in its appetite for petty carnage.

It is spotted with black upon a ground mixed with red and grey, the spots distinct and separate upon the sides, but uniting towards the back, and forming black stripes which run longitudi nal-

ly from the neck backwards.

The Genet like the Ermine and the Civet, has glands that secrete a kind of perfume. It differs from them, however, in one respect, and that is Indians. in being easily tamed. Bellonius assures us that he has seen them in Constantinople as tame as cats; and that they were permitted to run every where about without doing the least mischief. For this reason they are called the cats of Constantinople, although they have nothing else in common with that animal, except their skill in spying out and destroying vermin. From such as have seen its uses at Constantinople, (continues Goldsmith, from whom I have copied the description) I learn that it is one of the most beautiful, cleanly, and industrious animals in the world-that it keeps whatever house it is in perfectly free from mice and rats. Add to this that its nature is mild and gentle, its colours various and glossy, and its fur valuable: and upon the twelve months the young trees may be trans-whole it seems to be one of those animals, planted at pleasure. At this age their growth is whole it seems to be one of those animals, whole it seems to be one of those animals, planted at pleasure. At this age their growth is that with proper care might be propagated amongst us, and might become one of the most serviceable of our domestics." Do not opportunity of the seed—its height is 66 inches, from the orange tree, may be placed the length nities sometimes occur with persons engaged in and breadth 30. the Smyrna trade, or to the naval officers on the Mediterranean station, to visit Constantinople? be, after the parent orange is ripe. It may be animals could be procured and brought over, an the tender sprouts is the frost in February. essential service would be rendered to all the cities on the maritime frontier; and the Southern and Western country might be speedily supplied from them.

If the neighbourhood of Constantinople be the native country of the Rat, as well as of the Ge- in February; but this operation should be limitnet, they are probably ancient enemies, and if the former has wandered away over the world in quest of adventures, it is proper that the latter should wander after it .- And there is a peculiar lopping; but if from a strong to a weaker soil, fitness in seeking and importing the remedy they should be trimmed and assisted by manure. from the same country that produced the disease.
RUSTICUS JUNIOR.

N. B. The subject of the foregoing communication, is of such general interest, that it will probably need no apology—or, it may be suffi-cient to say, that all the ordinary expedients for destroying such vermin have failed .- Traps, arsenic, and nux vomita may succeed two or three times, but no more. The rats discover and avoid them.—I have another communication to make respecting the cross between the native Buffaloe, and the English Black Cattle, but defer it to a more convenient season, under the assurance that the above will be enough for the present.

With much respect, I remain, your obed't serv't, and sincere friend,

JOHN S. SKINNER, Esq. Baltimore, Md.

FROM THE EAST FLORIDA HERALD-July 24.
